## DevOps-Project-Kubernetes-Multicluster-Multicloud

### Module 1: DevOps-Project-Kubernetes-Multicluster-using-Istio-and-DisasterRecovery-Multicloud

Kubernetes Multicluster refers to managing and deploying multiple Kubernetes Clusters as a single and unified platform.

I don not want to make this concept difficult by drawing mind numbing diagrams. As shown in the self-explanatory diagram drawn above, I had created a single mesh using Istio and two Kubernetes Clusters (AKS Cluster and EKS Cluster) with the help of **Istio Eastwest Gateway** which is **Gateway in Istio for internal cross-cluster communication**. I had created AKS (Azure Kubernetes Services) Cluster and EKS (Elastic Kubernetes Services) Cluster using the Terraform Script present in the GitHub Repo <https://github.com/singhritesh85/DevOps-Project-Kubernetes-Multicluster-Multicloud.git>. After creation of the two Kubernetes Cluster (AKS and EKS Cluster) I installed Istio in each of the Kubernetes Cluster using helm. Before installing the Istio I create the Root CA Certificate and generated intermediate certificate for each cluster. A common root CA certificate is used to establish a shared trust and enable secure communication across clusters. I installed Istio using **multi-primary on different networks**.

I installed terraform on Alma Linux2 Azure VM and State file was kept in the S3 Bucket and state lock had been achieved using the AWS DynamoDB. Before running the terraform script I ran the shell script present in the directory **terraform-multi-kubernetes-cluster-multicloud** as shown in the screenshot attached below. This shell script will install the aws cli, kubectl and helm.

```
[root@XXXXXXXXXX terraform-multi-kubernetes-cluster-multicloud]# ./initial-setup.sh
Then I logged-out and login again ran the command aws configure as shown in the screenshot
```

attached below. As it is an important step to Authenticate and Authorize the user before creating resources using terraform in the AWS Account.

```
[root@yellowbox terraform-multi-kubernetes-cluster-multicloud]# cd main/  
[root@yellowbox main]# aws configure  
AWS Access Key ID [*****]: yellowbox  
AWS Secret Access Key [*****]: yellowbox  
Default region name []: yellowbox  
Default output format []: yellowbox  
[root@yellowbox main]#
```

Then I installed Azure CLI and authenticated and Authorize the user as shown in the screenshot attached below.

```
[root@] main]# yum install -y https://packages.microsoft.com/config/rhel/8/packages-microsoft-prod.rpm  
[root@] main]# yum install azure-cli -y  
[root@] main]# az login  
To sign in, use a web browser to open the page [REDACTED] and enter the code [REDACTED] to authenticate.
```

Then you can run the below commands

**terraform init** -----> initializes a working directory containing configuration files and installs plugins for required providers.

**terraform validate** -----> verify that terraform configuration file is correct or not

**terraform plan** -----> Check which resources are going to be created.

Then you can run the command **terraform apply -auto-approve** ----> Finally, Create the resources.

After creation of the resources a kubeconfig file was generated, I did below change in the kubeconfig file as shown in the screenshot attached below.

```
server: https://aks-cluster-dns-[REDACTED].eastus.[REDACTED].io:443
name: aks-cluster
- cluster:
  certificate-authority-data: [REDACTED]

[REDACTED]

server: https://[REDACTED] us-east-2.eks.amazonaws.com
name: eks-demo-cluster-dev
contexts:
- context:
  cluster: aks-cluster
  user: clusterUser_aks-rg_aks-cluster
  name: aks-cluster
- context:
  cluster: eks-demo-cluster-dev
  user: arn:aws:eks:us-east-2:[REDACTED]:cluster/eks-demo-cluster-dev
  name: eks-demo-cluster-dev
current-context: aks-cluster
kind: Config
preferences: {}
users:
- name: clusterUser_aks-rg_aks-cluster
  user:
    client-certificate-data: [REDACTED]

[REDACTED]
```

It is my suggestion before any change in the kubeconfig file take a backup of the original kubeconfig file.

Install Istioctl as shown in the screenshot attached below.

```
[root@yellow ~]# curl -L https://istio.io/downloadIstio | sh -
% Total    % Received % Xferd  Average Speed   Time   Time  Current
                                         Dload  Upload   Total   Spent   Left  Speed
100  101  100  101    0      0  371      0 --:--:-- --:--:-- --:--:--  369
100  5124  100  5124    0      0 17488      0 --:--:-- --:--:-- --:--:-- 17488

Downloading istio-1.25.2 from https://github.com/istio/istio/releases/download/1.25.2/istio-1.25.2-linux-amd64.tar.gz ...
Istio 1.25.2 download complete!

The Istio release archive has been downloaded to the istio-1.25.2 directory.

To configure the istioctl client tool for your workstation,
add the /root/istio-1.25.2/bin directory to your environment path variable with:
export PATH="$PATH:/root/istio-1.25.2/bin"

Begin the Istio pre-installation check by running:
  istioctl x precheck

Try Istio in ambient mode
  https://istio.io/latest/docs/ambient/getting-started/
Try Istio in sidecar mode
  https://istio.io/latest/docs/setup/getting-started/
Install guides for ambient mode
  https://istio.io/latest/docs/ambient/install/
Install guides for sidecar mode
  https://istio.io/latest/docs/setup/install/

Need more information? Visit https://istio.io/latest/docs/
```

```
[root@yellow ~]# cat ~/.bashrc
# .bashrc

# User specific aliases and functions

alias rm='rm -i'
alias cp='cp -i'
alias mv='mv -i'

# Source global definitions
if [ -f /etc/bashrc ]; then
    . /etc/bashrc
fi

PATH=/usr/local/sbin:/sbin:/bin:/usr/sbin:/usr/bin:/root/bin:/usr/local/bin
PATH="$PATH:/root/istio-1.25.2/bin"
```

I created first the **istio-system** namespace in both the clusters (AKS and EKS Cluster) as shown in the screenshot attached below.

```
kubectl create ns istio-system --context=aks-cluster
kubectl create ns istio-system --context=eks-demo-cluster-dev
```

```
[root@yellow ~]# kubectl create ns istio-system --context=aks-cluster
namespace/istio-system created
[root@yellow ~]# kubectl create ns istio-system --context=eks-demo-cluster-dev
namespace/istio-system created
```

To create the Root CA certificate and certificate for each of the clusters I used make command and I install the same as shown in the screenshot attached below.

**yum groupinstall 'Development Tools' -y**

```
[root@yellow ~]# yum groupinstall 'Development Tools' -y
```

It will install Java-1.8 which you can uninstall later after creating the Root CA certificate and certificate for each of the clusters.

```
[root@yellow ~]# java -version
openjdk version "1.8.0_452"
OpenJDK Runtime Environment (build 1.8.0_452-b09)
OpenJDK 64-Bit Server VM (build 25.452-b09, mixed mode)
```

I used below command to create the Root CA certificate and certificate for each of the clusters.

```
mkdir certs
```

```
cd certs/
```

```
make -f ../istio-1.25.2/tools/certs/Makefile.selfsigned.mk root-ca
```

```
make -f ../istio-1.25.2/tools/certs/Makefile.selfsigned.mk aks-cluster-cacerts
```

```
make -f ../istio-1.25.2/tools/certs/Makefile.selfsigned.mk eks-demo-cluster-dev-cacerts
```

```
[root@yellow ~]# mkdir certs
[root@yellow ~]# cd certs/
[root@yellow certs]# make -f ../istio-1.25.2/tools/certs/Makefile.selfsigned.mk root-ca
generating root-key.pem
Generating RSA private key, 4096 bit long modulus (2 primes)
.....
.....
.....
e is 65537 (0x010001)
generating root-cert.csr
generating root-cert.pem
Signature ok
subject=O = Istio, CN = Root CA
Getting Private key
```

```
[root@yellow certs]# make -f ../istio-1.25.2/tools/certs/Makefile.selfsigned.mk aks-cluster-cacerts
generating aks-cluster/ca-key.pem
Generating RSA private key, 4096 bit long modulus (2 primes)
.....
.....
.....
.....
.....
.....
e is 65537 (0x010001)
generating aks-cluster/cluster-ca.csr
generating aks-cluster/ca-cert.pem
Signature ok
subject=O = Istio, CN = Intermediate CA, L = aks-cluster
Getting CA Private Key
generating aks-cluster/cert-chain.pem
Intermediate inputs stored in aks-cluster/
done
rm aks-cluster/cluster-ca.csr aks-cluster/intermediate.conf
```

```
[root@certs]# make -f ..istio-1.25.2/tools/certs/Makefile.selfsigned.mk eks-demo-cluster-dev-cacerts
generating eks-demo-cluster-dev/ca-key.pem
Generating RSA private key, 4096 bit long modulus (2 primes)
.....
.....
.....
e is 65537 (0xe10001)
generating eks-demo-cluster-dev/cluster-ca.csr
generating eks-demo-cluster-dev/ca-cert.pem
Signature ok
subject=O = Istio, CN = Intermediate CA, L = eks-demo-cluster-dev
Getting CA Private Key
generating eks-demo-cluster-dev/cert-chain.pem
Intermediate inputs stored in eks-demo-cluster-dev/
done
rm eks-demo-cluster-dev/intermediate.conf eks-demo-cluster-dev/cluster-ca.csr
```

Then created the kubernetes secrets **cacerts** in the namespace **istio-system** in each of the kubernetes cluster (AKS Cluster and EKS Cluster) as shown in the screenshot attached below.

```
kubectl create secret generic cacerts -n istio-system --context=aks-cluster --from-file=certs/aks-cluster/ca-cert.pem --from-file=certs/aks-cluster/ca-key.pem --from-file=certs/aks-cluster/root-cert.pem --from-file=certs/aks-cluster/cert-chain.pem

kubectl create secret generic cacerts -n istio-system --context=eks-demo-cluster-dev --from-file=certs/eks-demo-cluster-dev/ca-cert.pem --from-file=certs/eks-demo-cluster-dev/ca-key.pem --from-file=certs/eks-demo-cluster-dev/root-cert.pem --from-file=certs/eks-demo-cluster-dev/cert-chain.pem
```

```
[root@certs ~]# kubectl create secret generic cacerts -n istio-system --context=aks-cluster --from-file=certs/aks-cluster/ca-cert.pem --from-file=certs/aks-cluster/root-cert.pem --from-file=certs/aks-cluster/cert-chain.pem
secret/cacerts created
[root@certs ~]# kubectl create secret generic cacerts -n istio-system --context=eks-demo-cluster-dev --from-file=certs/eks-demo-cluster-dev/ca-cert.pem --from-file=certs/eks-demo-cluster-dev/ca-key.pem --from-file=certs/eks-demo-cluster-dev/root-cert.pem --from-file=certs/eks-demo-cluster-dev/cert-chain.pem
secret/cacerts created
```

For Istio installation I installed istio-base, istiod and then istio Eastwest gateway on AKS Cluster as shown in the screenshot attached below.

```
kubectl --context=aks-cluster get namespace istio-system && kubectl --context=aks-cluster label namespace istio-system topology.istio.io/network=network1

helm repo add istio https://istio-release.storage.googleapis.com/charts --kube-context=aks-cluster
helm repo update --kube-context=aks-cluster
helm install istio-base istio/base -n istio-system --kube-context aks-cluster
helm install istiod istio/istiod -n istio-system --kube-context aks-cluster --set global.meshID=mesh1
--set global.multiCluster.clusterName=aks-cluster --set global.network=network1
helm install istio-eastwestgateway istio/gateway -n istio-system --kube-context aks-cluster --set name=istio-eastwestgateway --set networkGateway=network1
kubectl --context=aks-cluster get svc istio-eastwestgateway -n istio-system
```

I applied the label **istio-system topology.istio.io/network=network1** to the namespace **istio-system** in AKS Cluster as shown in the screenshot attached below.

```
[root@yellow ~]# kubectl --context=aks-cluster get namespace istio-system && kubectl --context=aks-cluster label namespace istio-system topology.istio.io/network=network1
NAME      STATUS   AGE
istio-system  Active  32m
namespace/istio-system labeled

[root@yellow ~]# helm repo add istio https://istio-release.storage.googleapis.com/charts --kube-context=aks-cluster
"istio" already exists with the same configuration, skipping
[root@yellow ~]# helm repo update --kube-context=aks-cluster
Hang tight while we grab the latest from your chart repositories...
...Successfully got an update from the "ingress-nginx" chart repository
...Successfully got an update from the "istio" chart repository
Update Complete. Happy Helm-ing!
[root@yellow ~]# helm install istio-base istio/base -n istio-system --kube-context aks-cluster

[root@yellow ~]# helm install istiod istio/istiod -n istio-system --kube-context aks-cluster --set global.meshID=mesh1 --set global.multiCluster.clusterName=aks-cluster --set global.network=network1

[root@yellow ~]# helm install istio-eastwestgateway istio/gateway -n istio-system --kube-context aks-cluster --set name=istio-eastwestgateway --set networkGateway=network1

[root@yellow ~]# kubectl --context=aks-cluster get svc istio-eastwestgateway -n istio-system
NAME          TYPE        CLUSTER-IP    EXTERNAL-IP   PORT(S)           AGE
istio-eastwestgateway  LoadBalancer  10.42.33.33  <pending>    15021:30554/TCP,15443:31089/TCP,15012:30874/TCP,15017:30646/TCP   5s
[root@yellow ~]# kubectl --context=aks-cluster get svc istio-eastwestgateway -n istio-system --watch
NAME          TYPE        CLUSTER-IP    EXTERNAL-IP   PORT(S)           AGE
istio-eastwestgateway  LoadBalancer  10.42.33.33  4.12.59.59   15021:30554/TCP,15443:31089/TCP,15012:30874/TCP,15017:30646/TCP   12s

[root@yellow ~]# cat expose-services.yaml
apiVersion: networking.istio.io/v1
kind: Gateway
metadata:
  name: cross-network-gateway
spec:
  selector:
    istio: eastwestgateway
  servers:
    - port:
        number: 15443
        name: tls
        protocol: TLS
      tls:
        mode: AUTO_PASSTHROUGH
      hosts:
        - "*.*.local"
```

**kubectl --context=aks-cluster apply -n istio-system -f expose-services.yaml**

```
[root@yellow ~]# kubectl --context=aks-cluster apply -n istio-system -f expose-services.yaml
gateway.networking.istio.io/cross-network-gateway created
```

For Istio installation on EKS Cluster I installed istio-base, istiod and then istio Eastwest gateway on as shown in the screenshot attached below.

```
kubectl --context=eks-demo-cluster-dev get namespace istio-system && kubectl --context=eks-demo-cluster-dev label namespace istio-system topology.istio.io/network=network2

helm repo add istio https://istio-release.storage.googleapis.com/charts --kube-context=eks-demo-cluster-dev

helm repo update --kube-context=eks-demo-cluster-dev

helm install istio-base istio/base -n istio-system --kube-context eks-demo-cluster-dev

helm install istiod istio/istiod -n istio-system --kube-context eks-demo-cluster-dev --set global.meshID=mesh1 --set global.multiCluster.clusterName=eks-demo-cluster-dev --set global.network=network2

helm install istio-eastwestgateway istio/gateway -n istio-system --kube-context eks-demo-cluster-dev --set name=istio-eastwestgateway --set networkGateway=network2

kubectl --context=eks-demo-cluster-dev get svc istio-eastwestgateway -n istio-system
```

I applied the label **istio-system topology.istio.io/network=network2** to the namespace **istio-system** in EKS Cluster as shown in the screenshot attached below.

```
[root@yellow ~]# kubectl --context=eks-demo-cluster-dev get namespace istio-system && kubectl --context=eks-demo-cluster-dev label namespace istio-system topology.istio.io/network=network2
NAME      STATUS   AGE
istio-system   Active  45m
namespace/istio-system labeled
[root@yellow ~]# helm repo add istio https://istio-release.storage.googleapis.com/charts --kube-context=eks-demo-cluster-dev
[root@yellow ~]# helm repo update --kube-context=eks-demo-cluster-dev
Hang tight while we grab the latest from your chart repositories...
...Successfully got an update from the "ingress-nginx" chart repository
...Successfully got an update from the "istio" chart repository
Update Complete. Happy Helming!
[root@yellow ~]# helm install istio-base istio/base -n istio-system --kube-context eks-demo-cluster-dev
[root@yellow ~]# helm install istiod istio/istiod -n istio-system --kube-context eks-demo-cluster-dev --set global.meshID=mesh1 --set global.multiCluster.clusterName=eks-demo-cluster-dev --set global.network=network2
[root@yellow ~]# helm install istio-eastwestgateway istio/gateway -n istio-system --kube-context eks-demo-cluster-dev --set name=istio-eastwestgateway --set networkGateway=network2
[root@yellow ~]# kubectl --context=eks-demo-cluster-dev get svc istio-eastwestgateway -n istio-system
NAME        TYPE        CLUSTER-IP      EXTERNAL-IP      PORT(S)
istio-eastwestgateway  LoadBalancer  192.168.1.178    a.us-east-2.elb.amazonaws.com  15021:32127/TCP,15443:30396
/TCP,15012:31457/TCP,15017:30195/TCP  6s
```

```
cat expose-services.yaml
```

```
apiVersion: networking.istio.io/v1
kind: Gateway
metadata:
  name: cross-network-gateway
spec:
  selector:
    istio: eastwestgateway
  servers:
    - port:
        number: 15443
        name: tls
        protocol: TLS
      tls:
        mode: AUTO_PASSTHROUGH
  hosts:
    - "*.local"
```

```
[root@XXXXXXXXXX ~]# cat expose-services.yaml
apiVersion: networking.istio.io/v1
kind: Gateway
metadata:
  name: cross-network-gateway
spec:
  selector:
    istio: eastwestgateway
  servers:
    - port:
        number: 15443
        name: tls
        protocol: TLS
      tls:
        mode: AUTO_PASSTHROUGH
  hosts:
    - "*.local"
```

**kubectl --context=eks-demo-cluster-dev apply -n istio-system -f expose-services.yaml**

```
[root@yellow ~]# kubectl --context=eks-demo-cluster-dev apply -n istio-system -f expose-services.yaml
gateway.networking.istio.io/cross-network-gateway created
```

**Enable endpoint discovery in AKS and EKS Cluster**

**istioctl create-remote-secret --context=aks-cluster --name=aks-cluster | kubectl apply -f --context=eks-demo-cluster-dev**

**istioctl create-remote-secret --context=eks-demo-cluster-dev --name=eks-demo-cluster-dev | kubectl apply -f - --context=aks-cluster**

```
[root@yellow ~]# istioctl create-remote-secret --context=aks-cluster --name=aks-cluster | kubectl apply -f - --context=eks-demo-cluster-dev
secret/istio-remote-secret-aks-cluster created
[root@yellow ~]# istioctl create-remote-secret --context=eks-demo-cluster-dev --name=eks-demo-cluster-dev | kubectl apply -f - --context=aks-cluster
secret/istio-remote-secret-eks-demo-cluster-dev created
```

Now verify that istiod can communicate with the remote cluster control plan

**istioctl remote-clusters --context=aks-cluster**

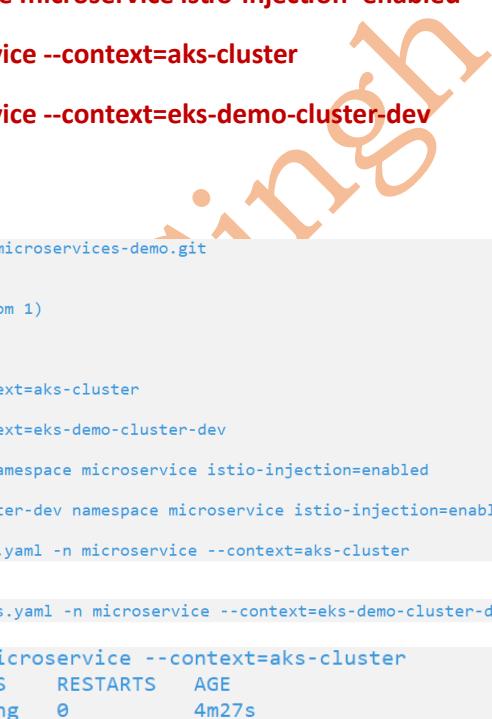

**istioctl remote-clusters --context=eks-demo-cluster-dev**

```
[root@yellow ~]# istioctl remote-clusters --context=aks-cluster
NAME      SECRET          STATUS    ISTIOD
aks-cluster
[root@yellow ~]# istioctl remote-clusters --context=eks-demo-cluster-dev
NAME      SECRET          STATUS    ISTIOD
eks-demo-cluster-dev
[root@yellow ~]# istioctl remote-clusters --context=eks-demo-cluster-dev
NAME      SECRET          STATUS    ISTIOD
eks-demo-cluster-dev
aks-cluster
```

Finally, Multicloud Kubernetes Cluster (with AKS and EKS Clusters) had been created using Istio with multi-primary on different networks.

Now I will demonstrate the **Disaster Recovery using multi-cluster**. To do so I will deploy the microservice in both the kubernetes cluster AKS and EKS cluster using the kubernetes manifests file present in GitHub Repo <https://github.com/singhritesh85/microservices-demo.git> at the path **microservices-demo/release/kubernetes-manifests.yaml**.

```
git clone https://github.com/singhritesh85/microservices-demo.git
cd microservices-demo/release/
kubectl create ns microservice --context=aks-cluster
kubectl create ns microservice --context=eks-demo-cluster-dev
kubectl label --context=aks-cluster namespace microservice istio-injection=enabled
kubectl label --context=eks-demo-cluster-dev namespace microservice istio-injection=enabled
kubectl apply -f kubernetes-manifests.yaml -n microservice --context=aks-cluster
kubectl apply -f kubernetes-manifests.yaml -n microservice --context=eks-demo-cluster-dev
```

```
[root@yellow ~]# git clone https://github.com/singhritesh85/microservices-demo.git
Cloning into 'microservices-demo'...
remote: Enumerating objects: 9164, done.
remote: Total 9164 (delta 0), reused 0 (delta 0), pack-reused 9164 (from 1)

```

I applied the label **istio-injection=enabled** in the **namespace microservice** on AKS and EKS Cluster due to which the Envoy Proxy containers was created to all the pods in this namespace.

```
[root@Terraform-Server release]# kubectl get svc -n microservice --context=aks-cluster
NAME          TYPE        CLUSTER-IP   EXTERNAL-IP      PORT(S)        AGE
adservice     ClusterIP  10.100.162.162 <none>        9555/TCP      5m45s
cartservice   ClusterIP  10.100.135.35  <none>        7070/TCP      5m45s

shippingservice ClusterIP 192.168.1.149 <none>        50051/TCP      5m42s
```

Then I installed ingress nginx controller in EKS Cluster which I considered as the primary cluster as shown in the screenshot attached below.

```
kubectl create ns ingress-nginx
helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
helm repo update
helm install ingress-nginx ingress-nginx/ingress-nginx -n ingress-nginx --set
controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-ssl-
cert"=arn:aws:acm:us-east-2:02XXXXXXXXXX6:certificate/XXXXXXXX-XXXX-XXXX-XXXX-
XXXXXXXXXXXX --set controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-
balancer-connection-idle-timeout"="60" --set
controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-cross-zone-load-
balancing-enabled"="true" --set
controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-type"="elb" --set
controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-backend-
protocol"="http" --set controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-
balancer-ssl-ports"="https" --set controller.service.targetPorts.https=http --set-string
controller.config.use-forwarded-headers="true"
```

```
[root@XXXXXXXXXXXX release]# kubectl create ns ingress-nginx
namespace/ingress-nginx created
[root@XXXXXXXXXXXX release]# helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
"ingress-nginx" already exists with the same configuration, skipping
[root@XXXXXXXXXXXX release]# helm repo update
Hang tight while we grab the latest from your chart repositories...
...Successfully got an update from the "ingress-nginx" chart repository
...Successfully got an update from the "istio" chart repository
Update Complete. Happy Helm-ing!
[root@XXXXXXXXXXXX release]#
[root@XXXXXXXXXXXX release]# helm install ingress-nginx ingress-nginx/ingress-nginx -n ingress-nginx --set controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-ssl-cert"=arn:aws:acm:us-east-2:02XXXXXXXXXX6:certificate/XXXXXXXX-XXXX-XXXX-XXXX-
XXXXXXXXXXXX --set controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-connection-idle-timeout"="60" --set controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-cross-zone-load-balancing-enabled"="true" --set controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-backend-protocol"="http" --set controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-ssl-ports"="https" --set controller.service.targetPorts.https=http --set-string controller.config.use-forwarded-headers="true"
```

Created the ingress rule and did the entry in Azure DNS Zone to create the Record Set for HOST with DNS Name of the LoadBalancer Service as shown in the screenshot attached below.

**singhritesh85.com | Recordsets**

A record set is a collection of records in a zone that have been loaded on this page. If you don't see what you load. [Learn more](#)

Fetched 3 record set(s).

Name	Type
@	NS
@	SOA

**Add record set**

Name: online-purchase.singhritesh85.com

Type: CNAME – Link your subdomain to another record

Alias record set: No

TTL: 1

TTL unit: Hours

Alias: a

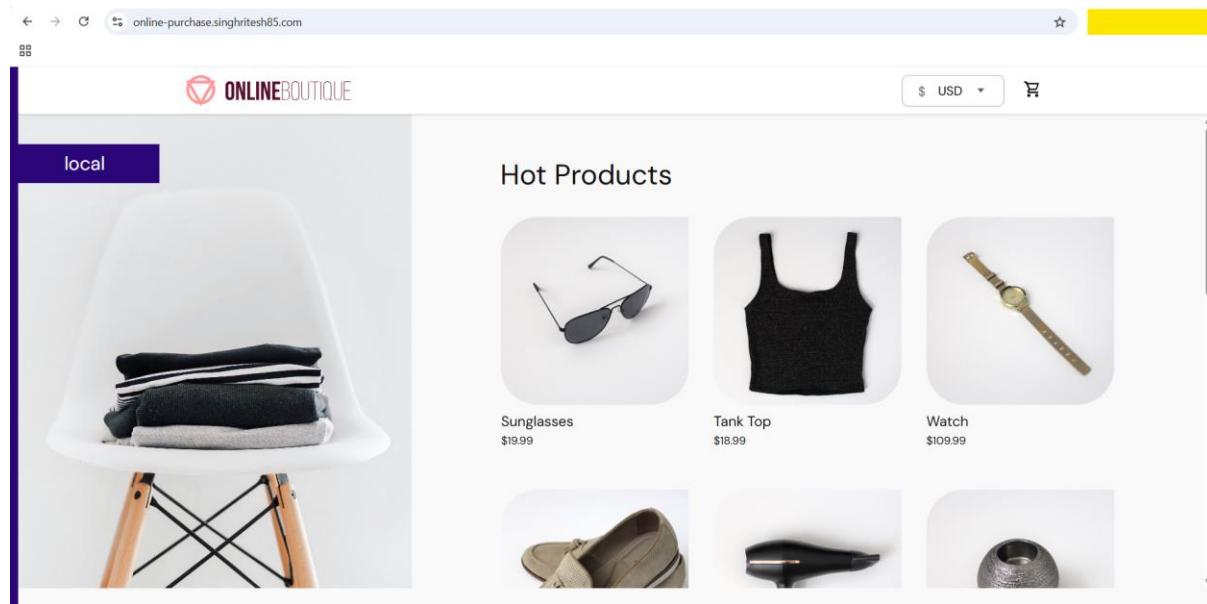

**Add** **Cancel** **Give feedback**

```
[root@REDACTED ~]# cat ingress-rule.yaml
apiVersion: networking.k8s.io/v1
kind: Ingress
metadata:
  name: microservice-ingress
  namespace: microservice
  annotations:
    kubernetes.io/ingress.class: nginx
spec:
  ingressClassName: nginx
  rules:
  - host: online-purchase.singhritesh85.com
    http:
      paths:
        - path: /
          pathType: Prefix
          backend:
            service:
              name: frontend-external
              port:
                number: 80
[root@REDACTED ~]# kubectl apply -f ingress-rule.yaml --context=eks-demo-cluster-dev
ingress.networking.k8s.io/microservice-ingress created
[root@REDACTED ~]# kubectl get ing -n microservice --context=eks-demo-cluster-dev
NAME           CLASS      HOSTS   ADDRESS          PORTS   AGE
microservice-ingress   nginx    online-purchase.singhritesh85.com   80      16s
[root@REDACTED ~]# kubectl get ing -n microservice --context=eks-demo-cluster-dev --watch

        service:
          name: frontend-external
        port:
          number: 80
```

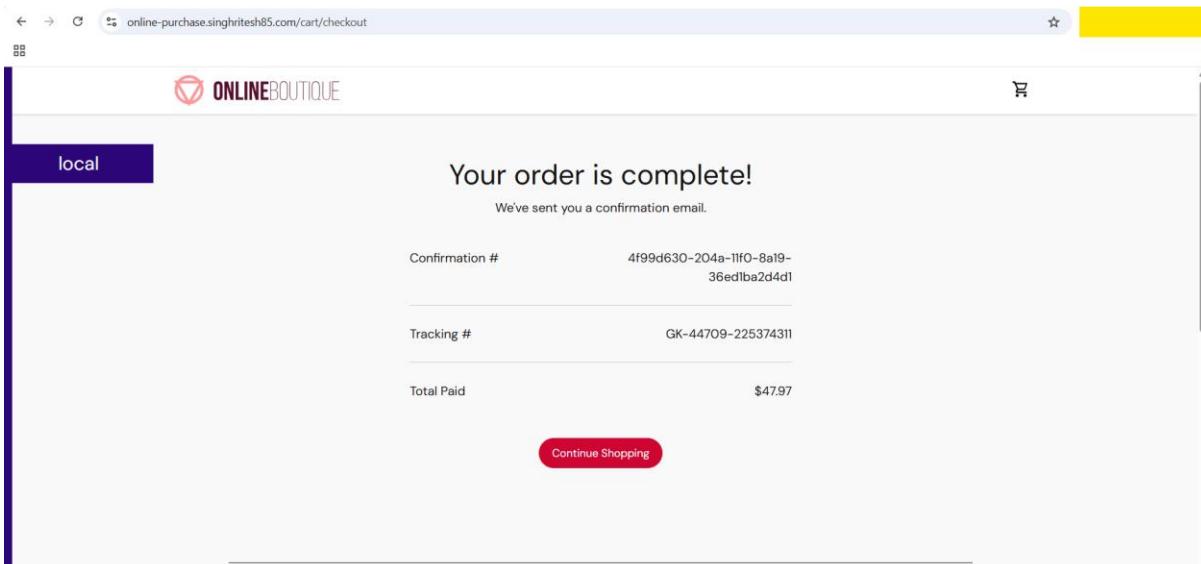

Finally, I was able to access the Application as shown in the screenshot attached below.

Now, I deleted the deployment for shipping service as shown in the screenshot attached below and tested that I was able to access the online shopping Application and the shipping service as shown in the screenshot attached below.

```
[root@] ~]# kubectl delete deploy shippingservice -n microservice --context=eks-demo-cluster-dev
deployment.apps "shippingservice" deleted
[root@] ~]# kubectl get pods -n microservice --context=eks-demo-cluster-dev

recommendationservice-  2/2     Running   0          34m
redis-cart-  2/2     Running   0          34m
```

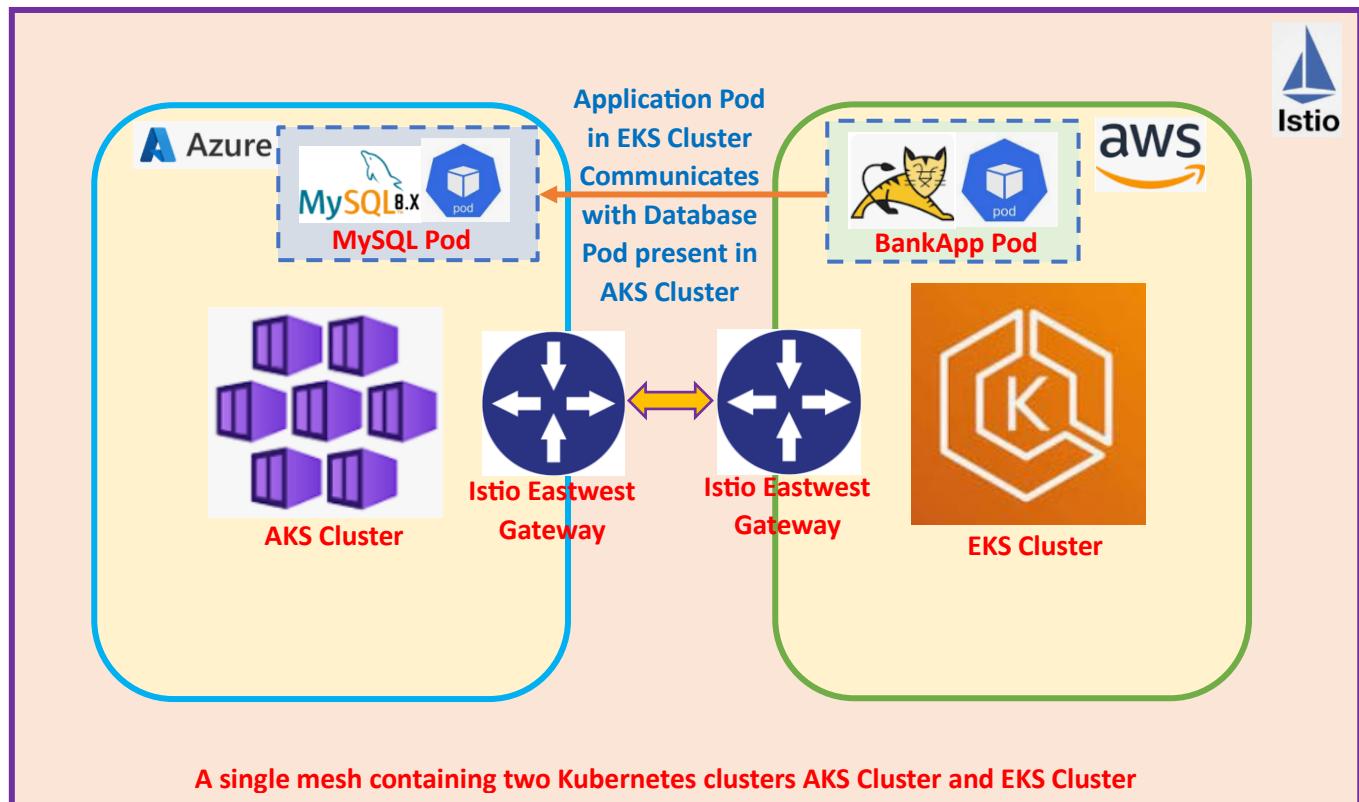

I had deleted the shipping service but I was able to access the Application and the shipping service successfully as shown in the screenshot attached above. The reason behind this is I had also deployed this Application in the AKS Cluster and Multicluster had been created between the AKS and EKS cluster and hence both will be considered as a single unit and when I deleted the shippingservice deployment from EKS Cluster but the same was present on the AKS Cluster so this was accessed through the AKS Cluster.

Ritesh Kumar Singh

## Module 2: DevOps-Project-BankApp-using-Kubernetes-Multicloud-and-Multicloud

As explained in **Module 1** I had created an AKS and EKS Cluster then established the Multicloud with the created AKS and EKS cluster using Istio. In the second module of the project, I created mysql pods (using the MySQL statefulset) and service in the namespace mysql in AKS Cluster and only the mysql service in the namespace mysql in the EKS Cluster. I provided the kubernetes label **istio-injection=enabled** to the namespace mysql in the AKS and EKS Cluster. Then I created the namespace bankapp in the EKS Cluster and provided the kubernetes label **istio-injection=enabled**.

In current module (Module 2) of the project the Application Pod present in the EKS Cluster communicates with the Database pod present in AKS Cluster. I had created the AKS and EKS Cluster using the Terraform script present in the GitHub Repo <https://github.com/singhritesh85/DevOps-Project-Kubernetes-Multicloud.git> at the path **module-1/terraform-multi-kubernetes-cluster-multicloud**. Then I created the Multicloud using Istio as explained in **Module 1**.

First, I created the namespace mysql in the AKS and EKS Cluster then provided the kubernetes label **istio-injection=enabled** as shown in the screenshot attached below.

```
[jenkins@[REDACTED] ~]$ kubectl create ns bankapp --context=eks-demo-cluster-dev
namespace/bankapp created
[jenkins@[REDACTED] ~]$ kubectl create ns mysql --context=aks-cluster
namespace/mysql created
[jenkins@[REDACTED] ~]$ kubectl label --context=aks-cluster namespace mysql istio-injection=enabled
namespace/mysql labeled
[jenkins@[REDACTED] ~]$ kubectl label --context=eks-demo-cluster-dev namespace bankapp istio-injection=enabled

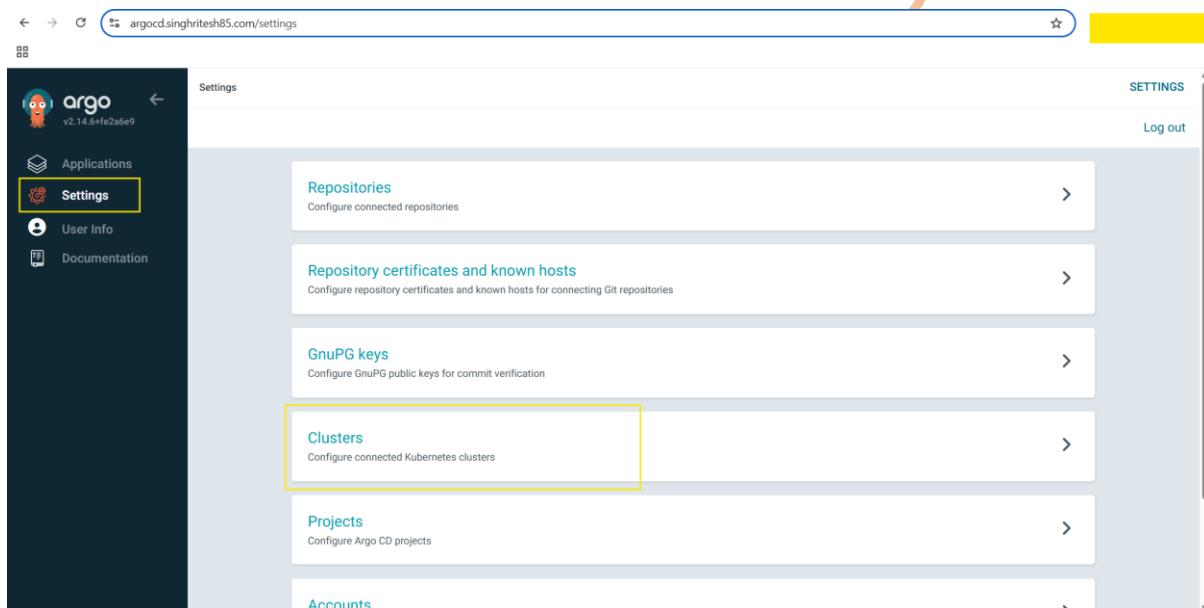

[root@Terraform-Server ~]# kubectl create ns mysql --context=eks-demo-cluster-dev
[jenkins@[REDACTED] ~]$ kubectl label --context=eks-demo-cluster-dev namespace mysql istio-injection=enabled
namespace/mysql labeled
```

```
[root@yellow ~]# kubectl get ns mysql --context=eks-demo-cluster-dev
NAME    STATUS  AGE   LABELS
mysql   Active  83m   istio-injection=enabled,kubernetes.io/metadata.name=mysql
[root@yellow ~]# kubectl get ns bankapp --context=eks-demo-cluster-dev
NAME    STATUS  AGE   LABELS
bankapp  Active  95m   istio-injection=enabled,kubernetes.io/metadata.name=bankapp
[root@yellow ~]# kubectl get ns mysql --context=aks-cluster
NAME    STATUS  AGE   LABELS
mysql   Active  74m   istio-injection=enabled,kubernetes.io/metadata.name=mysql
```

I had installed the ArgoCD in the EKS Cluster which steps I already discussed in Module 1. I had added the AKS Cluster in the created ArgoCD using the command **argocd cluster add aks-cluster** as shown in the screenshot attached below.

```
[root@yellow ~]# argocd cluster add aks-cluster
WARNING: This will create a service account 'argocd-manager' on the cluster referenced by context `aks-cluster` with full cluster level privileges. Do you want to continue [y/N]? y
INFO[0001] ServiceAccount "argocd-manager" already exists in namespace "kube-system"
INFO[0001] ClusterRole "argocd-manager-role" updated
INFO[0001] ClusterRoleBinding "argocd-manager-role-binding" updated
Cluster 'https://aks-cluster-dns-yellow.eastus.azurek8s.io:443' added
```

Then I went to the ArgoCD User Interface and go to **Settings > Clusters** as shown in the screenshot attached below.

NAME	URL	VERSION	CONNECTION STATUS
aks-cluster	https://aks-cluster-dns-[REDACTED].eastus.azurek8s.io:443	1.30	Unknown
in-cluster	https://kubernetes.default.svc	1.30+	Unknown

NAME	URL	VERSION	CONNECTION STATUS
aks-cluster	https://aks-cluster-dns-[REDACTED].eastus.azurek8s.io:443	1.30	Successful
in-cluster	https://kubernetes.default.svc	1.30+	Successful

**Initially connection status was not in Successful state, as I had done one deployment then it is showing Successful state**

After first deployment the **connection status** of Newly Added cluster will come into the Successful state. As I had done the deployment and then I am taking this screenshot So it is showing Successful state.

For CI/CD Tool I used Jenkins and below is the Jenkinsfile I used in the Project.

#### Jenkinsfile for MySQL

```

pipeline{
    agent{
        node{
            label "Slave-1"
            customWorkspace "/home/jenkins/mysql"
        }
    }
    environment{
        JAVA_HOME="/usr/lib/jvm/java-17-amazon-corretto.x86_64"
        PATH="$PATH:$JAVA_HOME/bin:/opt/apache-maven/bin:/usr/local/bin"
    }
    stages{
        stage("MySQL-Deployment"){
            steps{
                //MySQL
                sh 'argocd login argocd.singhritesh85.com --username admin --password Admin@123 --skip-test-tls --grpc-web'
                sh 'argocd app create mysql --project default --repo https://github.com/singhritesh85/helm-repo-for-bitnami.git --path ./bitnami/mysql --dest-namespace mysql --sync-option CreateNamespace=true --dest-server https://aks-cluster-dns-6ir8js3n.hcp.eastus.azurek8s.io:443 --helm-set secondary.replicaCount=1 --helm-set primary.persistence.enabled=true --helm-set primary.persistence.size=1Gi --helm-set architecture=replication --helm-set secondary.persistence.enabled=true --helm-set secondary.persistence.size=1Gi --helm-set primary.service.type=ClusterIP --helm-set auth.rootPassword=Dexter@123 --helm-set auth.database=bankappdb --helm-set global.storageClass=managed-csi --upsert'
                sh 'argocd app sync mysql'
                sh 'argocd app create mysql --project default --repo https://github.com/singhritesh85/helm-repo-for-bitnami-mysql-onlyservice.git --path ./bitnami/mysql --dest-namespace mysql --sync-option CreateNamespace=true --dest-server https://kubernetes.default.svc --helm-set secondary.replicaCount=1 --helm-set primary.persistence.enabled=false --helm-set architecture=replication --helm-set secondary.persistence.enabled=false --helm-set primary.service.type=ClusterIP --helm-set auth.rootPassword=Dexter@123 --helm-set auth.database=bankappdb --upsert'
                sh 'argocd app sync mysql'
            }
        }
    }
}

```

### Jenkinsfile for BankApp

```

pipeline{
    agent{
        node{
            label "Slave-1"
            customWorkspace "/home/jenkins/bankapp"
        }
    }
    environment{
        JAVA_HOME="/usr/lib/jvm/java-17-amazon-corretto.x86_64"
        PATH="$PATH:$JAVA_HOME/bin:/opt/apache-maven/bin:/opt/node-v16.0.0/bin:/usr/local/bin"
    }
    parameters {
        string(name: 'COMMIT_ID', defaultValue: "", description: 'Provide the Commit ID')
        string(name: 'REPO_NAME', defaultValue: "", description: 'Provide the ECR Repository Name for Application Image')
        string(name: 'TAG_NAME', defaultValue: "", description: 'Provide the TAG Name')
    }
    stages{
        stage("Clone-Code"){
            steps{
                cleanWs()
                checkout scmGit(branches: [[name: '${COMMIT_ID}']], extensions: [], userRemoteConfigs: [[credentialsId: 'github-cred', url: 'https://github.com/singhritesh85/Bank-App.git']])

            }
        }
        stage("Maven-Build"){
            steps{
                sh 'mvn clean install'
            }
        }
        stage("Docker Build"){
            steps{

```

```

sh 'docker system prune -f --all'

sh 'docker build -t ${REPO_NAME}:${TAG_NAME} -f Dockerfile-Project-1 .'

sh 'aws ecr get-login-password --region us-east-2 | docker login --username AWS --password-stdin
027330342406.dkr.ecr.us-east-2.amazonaws.com'

sh 'docker push ${REPO_NAME}:${TAG_NAME}'

}

}

stage("Deployment"){

steps{

sh 'argocd login argocd.singhritesh85.com --username admin --password Admin@123 --skip-test-tls --
grpc-web'

sh 'argocd app create bankapp --project default --repo https://github.com/singhritesh85/helm-repo-
for-Blue-Green-Deployment.git --path ./folo --dest-namespace bankapp --sync-option CreateNamespace=true -
--dest-server https://kubernetes.default.svc --helm-set service.port=80 --helm-set
image.repository=${REPO_NAME} --helm-set image.tag=${TAG_NAME} --helm-set replicaCount=1 --upsert'

sh 'argocd app sync bankapp'

}

}

}

}

```

Both the Jenkinsfile for MySQL and BankApp are present in the GitHub Repo  
<https://github.com/singhritesh85/DevOps-Project-Kubernetes-MultiCluster-MultiCloud.git> at the path **module-2**.

First, I ran the Jenkins Job mysql then bankapp and for Running Jenkins Job bankapp I had to provide three string parameters Commit ID, Repo Name and Image Tag as shown in the screenshot attached below.

Jenkins Pipeline bankapp configuration screen. The pipeline requires parameters: COMMIT\_ID (0123456789), REPO\_NAME (023456.dkr.ecr.us-east-2.amazonaws.com/bankapp), and TAG\_NAME (1.01). A 'Build' button is present.

For BankApp Deployment I did not use the SonarQube, Nexus and Trivy Image Scan. In this Project I did not use the Prometheus, Grafana, Loki and triggering Email for notification If you want to use these then you can refer the project present in the GitHub Repo <https://github.com/singhritesh85/DevOps-Project-BankApplication-BlueGreen-Deployment-MultiCloud.git>.

After successful deployment the screenshot of Jenkins Job is as shown below.

S	W	Name ↓	Last Success	Last Failure	Last Duration
		bankapp	5 min 19 sec #5	2 hr 28 min #3	33 sec
		mysql	8 min 4 sec #7	2 hr 37 min #5	11 sec

```
[root@yellow ~]# kubectl get pods -n bankapp --context=eks-demo-cluster-dev
NAME          READY   STATUS    RESTARTS   AGE
bankapp-folio-5 yellow   2/2     Running   0      28m
[root@yellow ~]# kubectl get svc -n bankapp --context=eks-demo-cluster-dev
NAME           TYPE        CLUSTER-IP   EXTERNAL-IP   PORT(S)   AGE
bankapp-folio-active ClusterIP  192.168.1.173 <none>       80/TCP    28m
bankapp-folio-preview ClusterIP  192.168.1.45  <none>       80/TCP    28m
[root@yellow ~]# kubectl get all -n mysql --context=eks-demo-cluster-dev
NAME           TYPE        CLUSTER-IP   EXTERNAL-IP   PORT(S)   AGE
service/mysql-primary ClusterIP  192.168.1.143 <none>       3306/TCP  32m
service/mysql-primary-headless ClusterIP  None        <none>       3306/TCP  32m
service/mysql-secondary ClusterIP  192.168.1.194 <none>       3306/TCP  32m
service/mysql-secondary-headless ClusterIP  None        <none>       3306/TCP  32m
[root@yellow ~]# kubectl get pods -n mysql --context=aks-cluster
NAME          READY   STATUS    RESTARTS   AGE
mysql-primary-0 2/2     Running   0      32m
mysql-secondary-0 2/2     Running   1 (30m ago) 32m
[root@yellow ~]# kubectl get pvc -n mysql --context=eks-demo-cluster-dev
NAME          STATUS   VOLUME   CAPACITY   ACCESS MODES   STORAGECLASS   VOLUMEATTRIBUTESCLASS   AGE
data-mysql-primary-0 Bound   pvc-5  1Gi       RWO         managed-csi   <unset>          32m
data-mysql-secondary-0 Bound   pvc-b  1Gi       RWO         managed-csi   <unset>          32m
[root@yellow ~]# kubectl get pvc -n mysql --context=eks-demo-cluster-dev
No resources found in mysql namespace.
```

To access the Application, I created the ingress rule for bankapp as shown in the screenshot attached below.

```
[jenkins@yellow ~]$ cat ingress-rule.yaml
---
apiVersion: networking.k8s.io/v1
kind: Ingress
metadata:
  name: bankapp-ingress
  namespace: bankapp
  annotations:
    kubernetes.io/ingress.class: nginx
spec:
  ingressClassName: nginx
  rules:
  - host: bankapp.singhritesh85.com
    http:
      paths:
      - path: /
        backend:
          service:
            name: bankapp-folo-active
            port:
              number: 80
            pathType: Prefix
[jenkins@yellow ~]$ kubectl apply -f ingress-rule.yaml --context=eks-demo-cluster-dev
ingress.networking.k8s.io/bankapp-ingress created
[jenkins@yellow ~]$ kubectl get ing -A --context=eks-demo-cluster-dev
NAMESPACE NAME CLASS HOSTS ADDRESS PORTS AGE
argocd minimal-ingress nginx argocd.singhritesh85.com a yellow 3.us-east-2.elb.amazonaws.com 80 7h23m
bankapp bankapp-ingress nginx bankapp.singhritesh85.com
[jenkins@yellow ~]$ kubectl get ing -A --context=eks-demo-cluster-dev --watch
NAMESPACE NAME CLASS HOSTS ADDRESS PORTS AGE
argocd minimal-ingress nginx argocd.singhritesh85.com a yellow 3.us-east-2.elb.amazonaws.com 80 7h23m
bankapp bankapp-ingress nginx bankapp.singhritesh85.com
bankapp bankapp-ingress nginx bankapp.singhritesh85.com a yellow 3.us-east-2.elb.amazonaws.com 80 23s
bankapp bankapp-ingress nginx bankapp.singhritesh85.com a yellow 3.us-east-2.elb.amazonaws.com 80 38s
```

I did the entry in Azure DNS Zone to create the Record Set of type CNAME corresponding to HOSTS and the DNS Name as shown in the screenshot attached below.

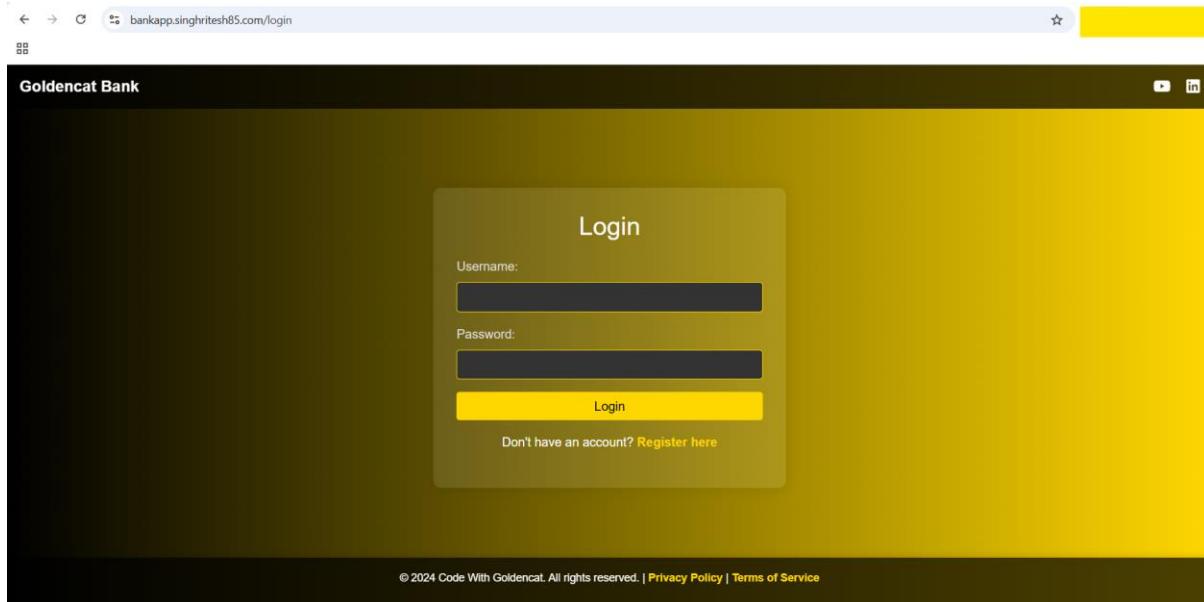

The screenshot shows the Azure DNS Management portal for the domain singhritesh85.com. On the left, there's a navigation menu with options like Overview, Activity log, Access control (IAM), Tags, Diagnose and solve problems, Resource visualizer, Settings, Locks, Properties, and DNS Management (with sub-options Recordsets and DNSSEC). The main area displays a table of existing records:

	Name	Type	TTL	Value
1	@	NS	172800	(redacted)
2	@	SOA	3600	(redacted)
3	bankapp	CNAME	3600	elb.amazonaws.com

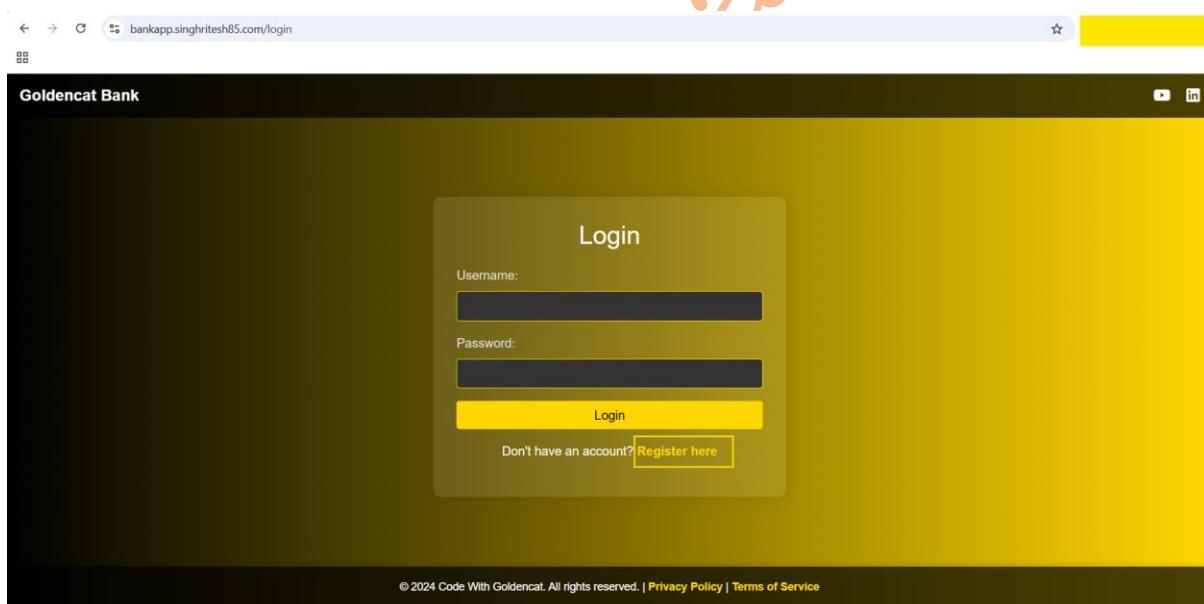

To the right, a modal window titled "Add record set" is open, showing the configuration for a new CNAME record named "bankapp". The "Type" is set to "CNAME – Link your subdomain to another record". The "Value" field contains "elb.amazonaws.com". Other fields include "Name" (bankapp), "TTL" (1), "TTL unit" (Hours), and "Alias" (No).

I want to mention here that **Argocd CLI** should be installed on Jenkins Slave node. Install **Argo Rollout Controller** and **Argo Rollouts Kubectl plugin** on both **aks-cluster** and **eks-demo-cluster-dev**.

Finally, I accessed the Application using the URL as shown in the screenshot attached below.

I registered with a user in BankApp and checked the user in the MySQL Pod and found its entry was present there.

### **Module 3: DevOps-Project-Kubernetes-BankApp-and-MySQL-Pods-on-Diferent-clusters-Multicloud**

I had created an AKS Cluster and an EKS Cluster using the terraform script present in the GitHub Repo <https://github.com/singhritesh85/DevOps-Project-Kubernetes-Multicluster-Multicloud.git> at the path **module-3/terraform-different-kubernetes-cluster-multicloud**.

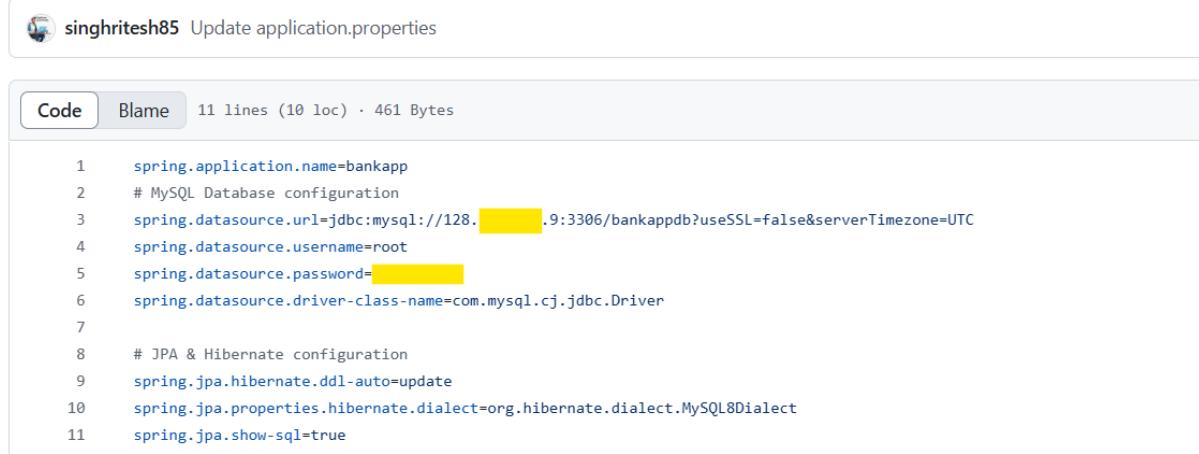

I had installed the ArgoCD in the EKS Cluster which steps I already discussed in Module 1. I had added the AKS Cluster in the created ArgoCD using the command **argocd cluster add aks-cluster** as discussed in Module 2. **Argocd CLI** should be installed on Jenkins Slave node. Install **Argo Rollout Controller** and **Argo Rollouts Kubectl plugin** on both **aks-cluster** and **eks-demo-cluster-dev** as discussed in **Module 2**.

In **Module-3** I did not use the concept of Multicluster and the Application Pod present on EKS Cluster will communicate with the MySQL Pod present on the AKS Cluster using LoadBalancer Service External IP. I ran the Jenkins Job for MySQL first and the LoadBalancer Service External IP had been provided to the file **application.properties** present at the path **src/main/resources/application.properties** GitHub Repo <https://github.com/singhritesh85/Bank-App.git> as shown in the screenshot attached below.

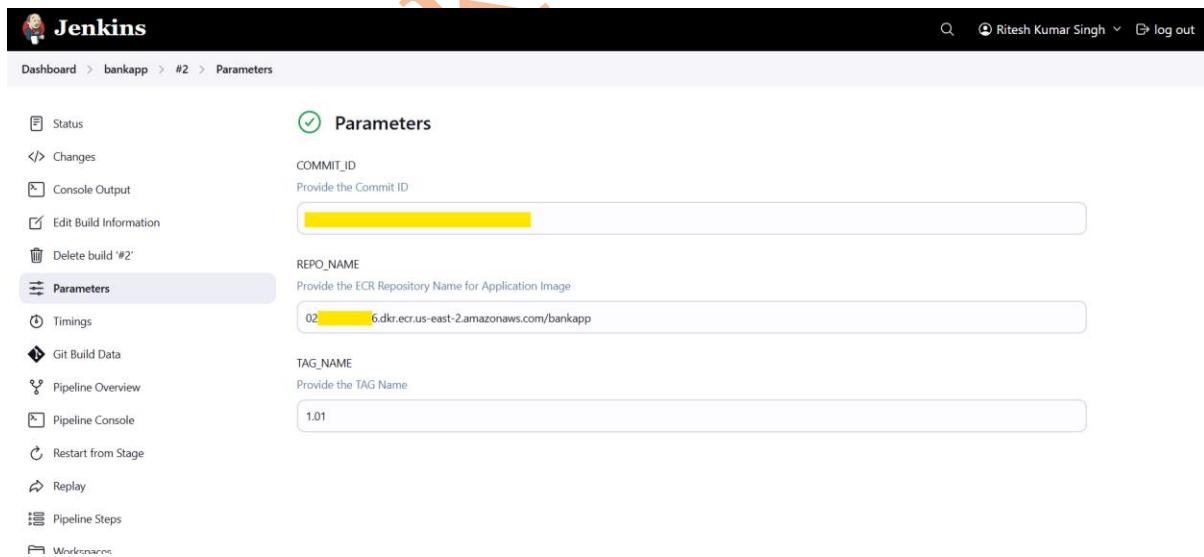

```
[root@yellow ~]# kubectl get pods -n mysql --context=aks-cluster --watch
NAME        READY   STATUS    RESTARTS   AGE
mysql-primary-0  1/1     Running   0          110s
mysql-secondary-0 1/1     Running   0          110s
^C[root@yellow ~]#
[root@yellow ~]# kubectl get svc -n mysql --context=aks-cluster --watch
NAME           TYPE      CLUSTER-IP   EXTERNAL-IP   PORT(S)   AGE
mysql-primary   LoadBalancer  10.yellow.82  128.yellow.9  3306:32246/TCP  115s
mysql-primary-headless ClusterIP  None        <none>       3306/TCP   115s
mysql-secondary ClusterIP  10.yellow.21  <none>       3306/TCP   115s
mysql-secondary-headless ClusterIP  None        <none>       3306/TCP   115s
```

[Bank-App](#) / src / main / resources / application.properties

```
spring.application.name=bankapp
# MySQL Database configuration
spring.datasource.url=jdbc:mysql://128.yellow.9:3306/bankappdb?useSSL=false&serverTimezone=UTC
spring.datasource.username=root
spring.datasource.password=yellow
spring.datasource.driver-class-name=com.mysql.cj.jdbc.Driver
#
# JPA & Hibernate configuration
spring.jpa.hibernate.ddl-auto=update
spring.jpa.properties.hibernate.dialect=org.hibernate.dialect.MySQL8Dialect
spring.jpa.show-sql=true
```

String Parameters which I provided to ran the Jenkins Job Bankapp is as shown in the screenshot attached below.

The Jenkinsfile for MySQL and Bankapp is as shown in the screenshot attached below.

### Jenkinsfile for MySQL

```

pipeline{
    agent{
        node{
            label "Slave-1"
            customWorkspace "/home/jenkins/mysql"
        }
    }
    environment{
        JAVA_HOME="/usr/lib/jvm/java-17-amazon-corretto.x86_64"
        PATH="$PATH:$JAVA_HOME/bin:/opt/apache-maven/bin:/usr/local/bin"
    }
    stages{
        stage("MySQL-Deployment"){
            steps{
                //MySQL
                sh 'argocd login argocd.singhritesh85.com --username admin --password Admin@123 --skip-test-tls --grpc-web'
                sh 'argocd app create mysql --project default --repo https://github.com/singhritesh85/helm-repo-for-bitnami.git --path ./bitnami/mysql --dest-namespace mysql --sync-option CreateNamespace=true --dest-server https://aks-cluster-dns-b190ise8.hcp.eastus.azmk8s.io:443 --helm-set secondary.replicaCount=1 --helm-set primary.persistence.enabled=true --helm-set primary.persistence.size=1Gi --helm-set architecture=replication --helm-set secondary.persistence.enabled=true --helm-set secondary.persistence.size=1Gi --helm-set primary.service.type=ClusterIP --helm-set auth.rootPassword=Dexter@123 --helm-set auth.database=bankappdb --helm-set primary.service.type=LoadBalancer --helm-set global.storageClass=managed-csi --upsert'

                sh 'argocd app sync mysql'
            }
        }
    }
}

```

### Jenkinsfile for Bankapp

```

pipeline{
    agent{
        node{
            label "Slave-1"
            customWorkspace "/home/jenkins/bankapp"
        }
    }
    environment{
        JAVA_HOME="/usr/lib/jvm/java-17-amazon-corretto.x86_64"
        PATH="$PATH:$JAVA_HOME/bin:/opt/apache-maven/bin:/opt/node-v16.0.0/bin:/usr/local/bin"
    }
    parameters {
        string(name: 'COMMIT_ID', defaultValue: "", description: 'Provide the Commit ID')
        string(name: 'REPO_NAME', defaultValue: "", description: 'Provide the ECR Repository Name for Application Image')
        string(name: 'TAG_NAME', defaultValue: "", description: 'Provide the TAG Name')
    }
    stages{
        stage("Clone-Code"){
            steps{
                cleanWs()
                checkout scmGit(branches: [[name: '${COMMIT_ID}']], extensions: [], userRemoteConfigs: [[credentialsId: 'github-cred', url: 'https://github.com/singhritesh85/Bank-App.git']])}
        }
        stage("Maven-Build"){
            steps{
                sh 'mvn clean install'
            }
        }
        stage("Docker Build"){
    
```

```
steps{
    sh 'docker system prune -f --all'
    sh 'docker build -t ${REPO_NAME}:${TAG_NAME} -f Dockerfile-Project-1 .'
    sh 'aws ecr get-login-password --region us-east-2 | docker login --username AWS --password-stdin 027330342406.dkr.ecr.us-east-2.amazonaws.com'
    sh 'docker push ${REPO_NAME}:${TAG_NAME}'
}
}

stage("Deployment"){
    steps{
        sh 'argocd login argocd.singhritesh85.com --username admin --password Admin@123 --skip-test-tls --grpc-web'
        sh 'argocd app create bankapp --project default --repo https://github.com/singhritesh85/helm-repo-for-Blue-Green-Deployment.git --path ./folio --dest-namespace bankapp --sync-option CreateNamespace=true --dest-server https://kubernetes.default.svc --helm-set service.port=80 --helm-set image.repository=${REPO_NAME} --helm-set image.tag=${TAG_NAME} --helm-set replicaCount=1 --upsert'
        sh 'argocd app sync bankapp'
    }
}
}
```

Ingress Rule for Bankapp is as shown in the screenshot attached below.

```
[root@REDACTED ~]# cat ingress-rule.yaml
---
apiVersion: networking.k8s.io/v1
kind: Ingress
metadata:
  name: bankapp-ingress
  namespace: bankapp
  annotations:
    kubernetes.io/ingress.class: nginx
spec:
  ingressClassName: nginx
  rules:
  - host: bankapp.singhritesh85.com
    http:
      paths:
      - path: /
        backend:
          service:
            name: bankapp-folo-active
            port:
              number: 80
        pathType: Prefix
[root@REDACTED ~]# kubectl apply -f ingress-rule.yaml --context=eks-demo-cluster-dev
ingress.networking.k8s.io/bankapp-ingress created
[root@REDACTED ~]# kubectl get ing -A --context=eks-demo-cluster-dev --watch
NAMESPACE   NAME           CLASS      HOSTS          ADDRESS          PORTS   AGE
argocd      minimal-ingress  nginx     argocd.singhritesh85.com  aREDACTED.4.us-east-2.elb.amazonaws.com  80      21m
bankapp     bankapp-ingress  nginx     bankapp.singhritesh85.com  aREDACTED.4.us-east-2.elb.amazonaws.com  80      13s
bankapp     bankapp-ingress  nginx     bankapp.singhritesh85.com  aREDACTED.4.us-east-2.elb.amazonaws.com  80      27s
```

I had done the entry for HOSTS with DNS Name in Azure DNS Zone to create the record set of type **CNAME** as shown in the screenshot attached below.

**Add record set**

Name: bankapp

Type: CNAME – Link your subdomain to another record

Alias record set: No

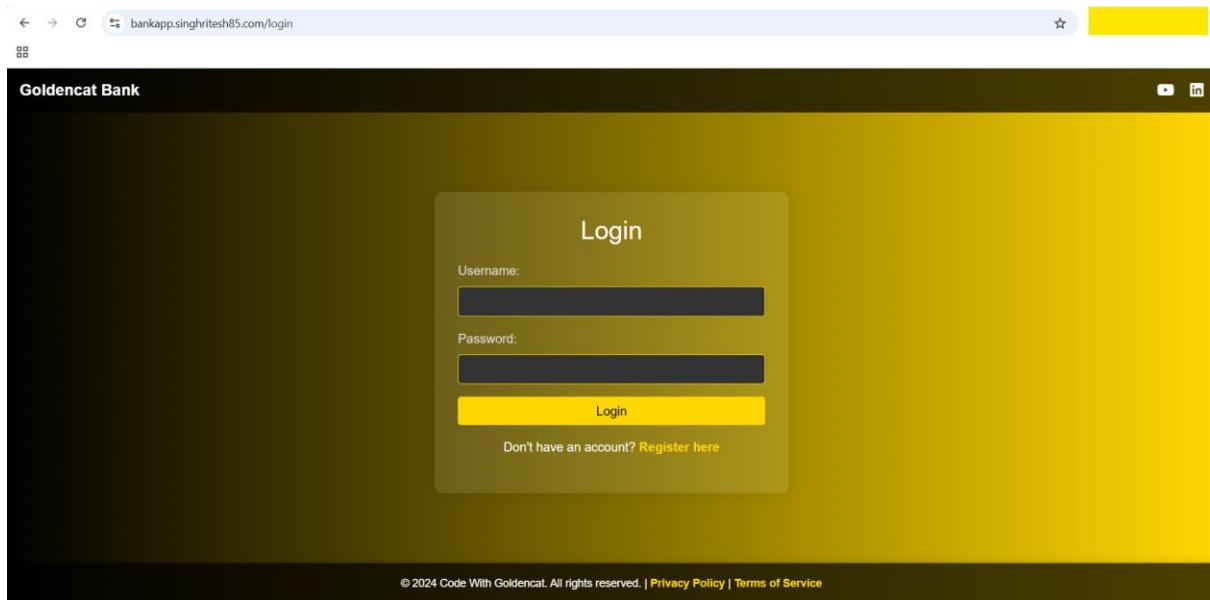

TTL: 1

TTL unit: Hours

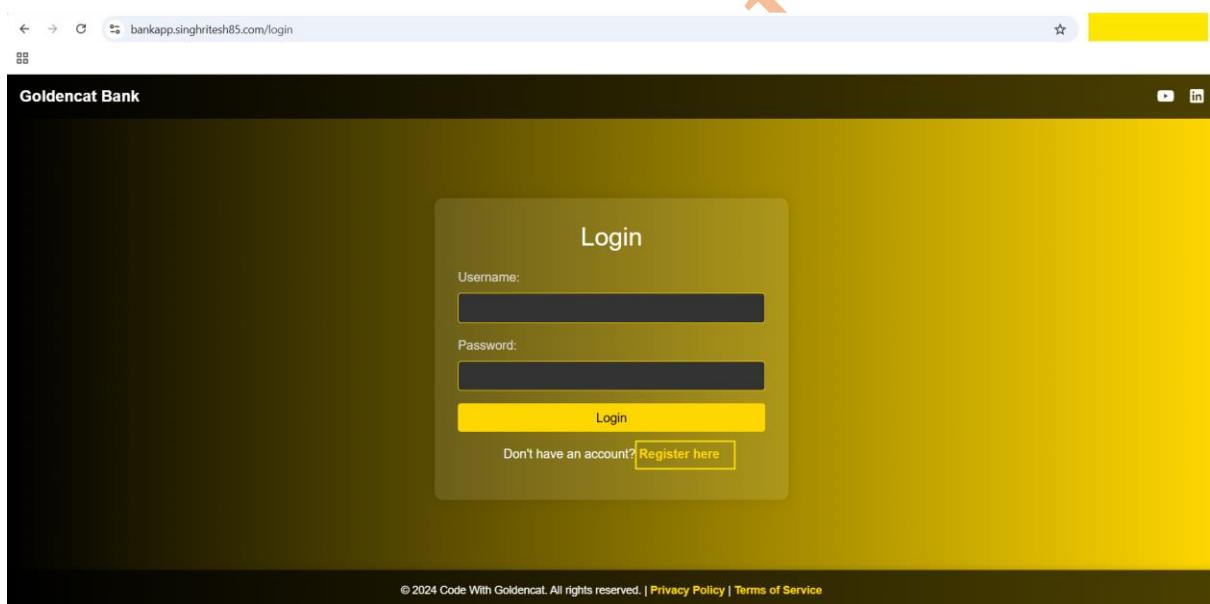

Alias: a.REDACTED

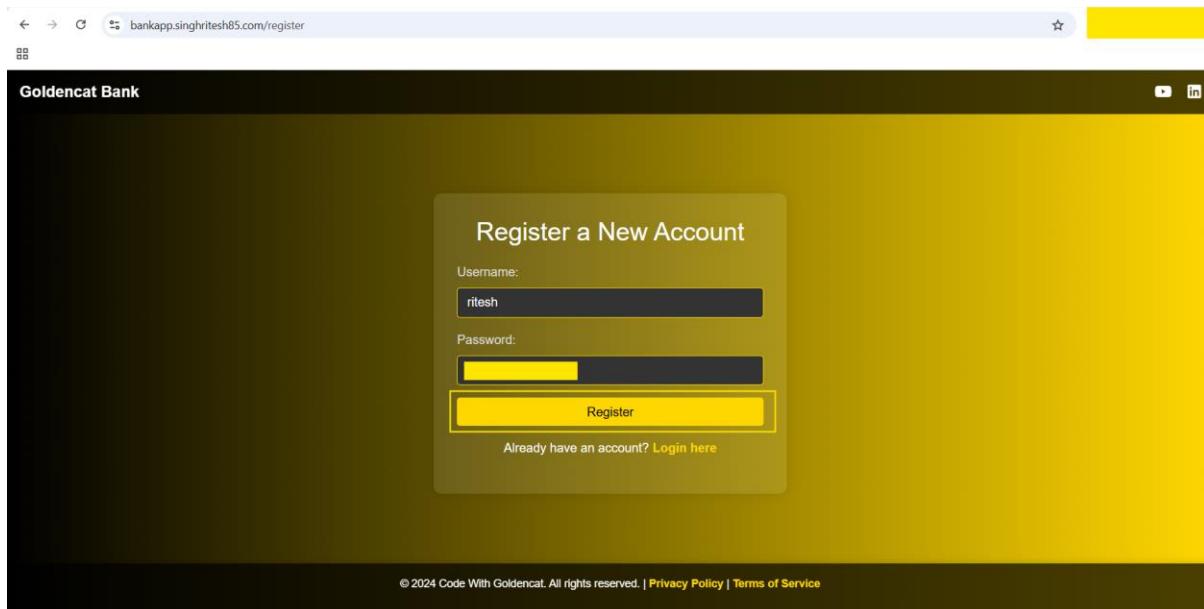

Add Cancel Give feedback

Finally, I was able to access the Application as shown in the screenshot attached below.

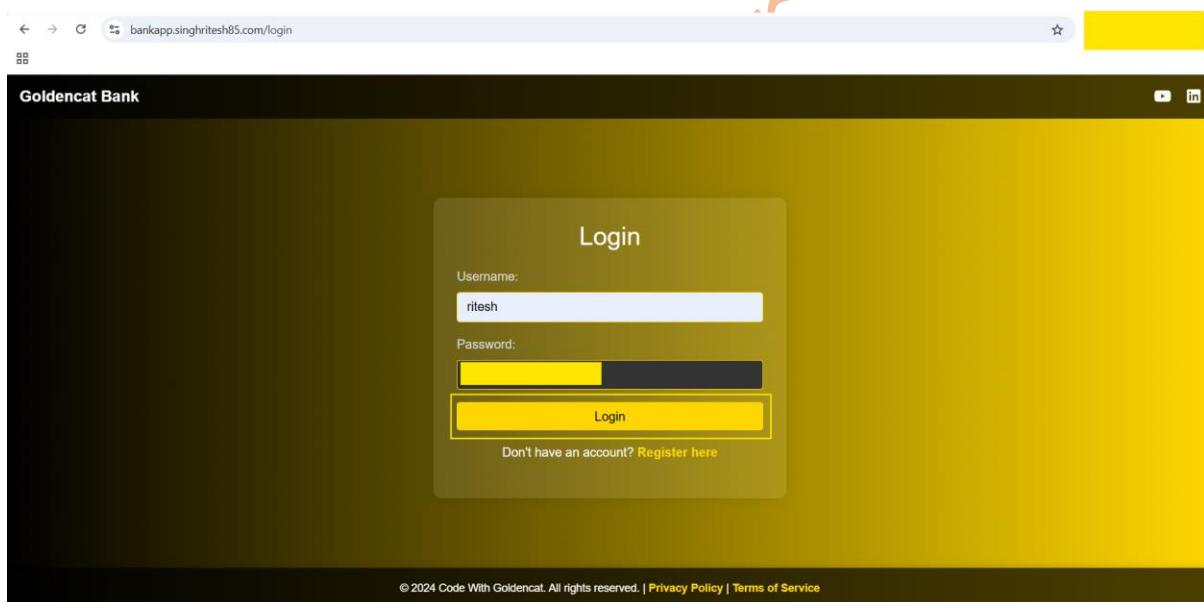

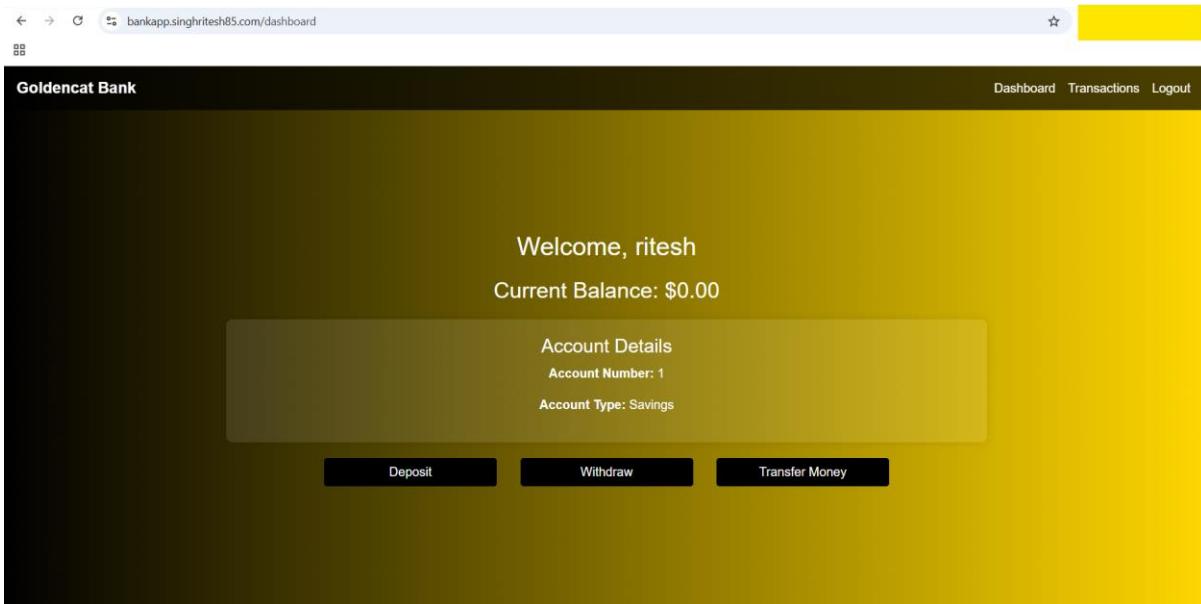

I registered with a user in this Bankapp and checked the entry for MySQL database and found the same user which I registered in the Bankapp as shown in the screenshot attached below.

I logged-in with the registered user and found I was able to login successfully.

```
[root@██████████ ~]# kubectl exec -it mysql-primary-0 bash -n mysql --context=aks-cluster
kubectl exec [POD] [COMMAND] is DEPRECATED and will be removed in a future version. Use kubectl exec [POD] -- [COMMAND] instead.
Defaulted container "mysql" out of: mysql, preserve-logs-symlinks (init)
I have no name!@mysql-primary-0:/$ mysql -h localhost -u root --password

```

For BankApp Deployment I did not use the SonarQube, Nexus and Trivy Image Scan. In this Project I did not use the Prometheus, Grafana, Loki and triggering Email for notification If you want to use these then you can refer the project present in the GitHub Repo

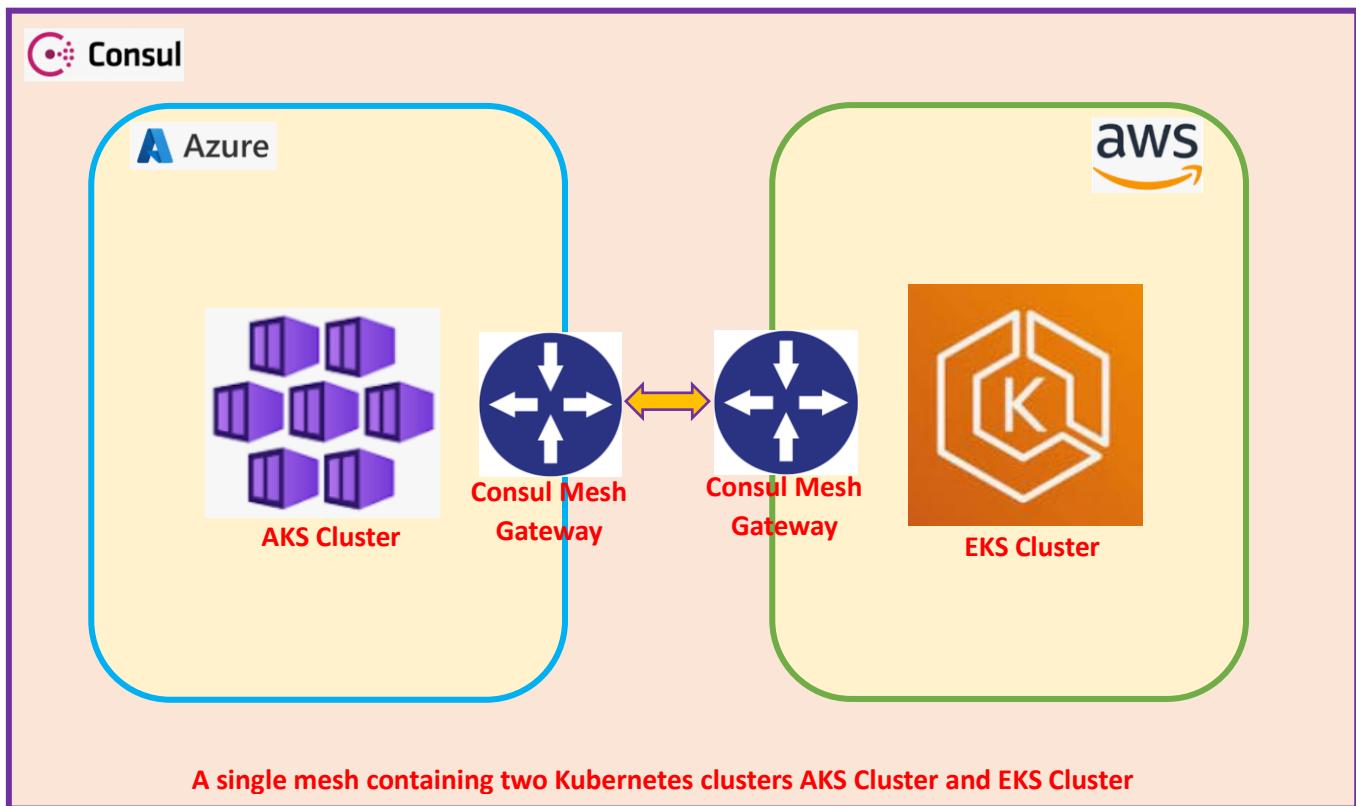

<https://github.com/singhritesh85/DevOps-Project-BankApplication-BlueGreen-Deployment-MultiCloud.git>.

The screenshot for ArgoCD after successfully running both the Jenkins Job bankapp and mysql is as shown in the screenshot attached below.

Ritesh Kumar Singh

#### Module 4: DevOps-Project-Kubernetes-Multicloud-using-Consul-and-DisasterRecovery-Multicloud

I had created an AKS Cluster and an EKS Cluster using the terraform script present in the GitHub Repo <https://github.com/singhritesh85/DevOps-Project-Kubernetes-Multicloud.git> at the path **module-4/terraform-multi-kubernetes-cluster-multicloud**.

I had installed nginx ingress controller in AKS and EKS Cluster as shown in the screenshot attached below.

#### Installation of Nginx Ingress Controller in AKS Cluster

```
kubectl create ns ingress-nginx
helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
helm repo update
helm install ingress-nginx ingress-nginx/ingress-nginx -n ingress-nginx
helm upgrade ingress-nginx ingress-nginx/ingress-nginx --namespace ingress-nginx --set
controller.service.annotations."service\.beta\.kubernetes\.io/azure-load-balancer-health-probe-
request-path"=/healthz --set controller.service.externalTrafficPolicy=Local
```

```
[root@yellow ~]# kubectl config get-contexts
CURRENT  NAME          CLUSTER          AUTHINFO           NAMESPACES
*        aks-cluster    aks-cluster    clusterUser_aks_aks-cluster
        eks-demo-cluster-dev  eks-demo-cluster-dev  arn:aws:eks:us-east-2:02XXXXXX6:cluster/eks-demo-cluster-dev

[root@yellow ~]# kubectl create ns ingress-nginx
namespace/ingress-nginx created
[root@yellow ~]# helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
"ingress-nginx" has been added to your repositories
[root@yellow ~]# helm repo update
Hang tight while we grab the latest from your chart repositories...
...Successfully got an update from the "ingress-nginx" chart repository
Update Complete. ⚡Happy Helm-ing!⚡
[root@yellow ~]# helm install ingress-nginx ingress-nginx/ingress-nginx -n ingress-nginx

[root@yellow ~]# helm upgrade ingress-nginx ingress-nginx/ingress-nginx --namespace ingress-nginx --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/azure-load-balancer-health-probe-request-path"/=healthz --set controller.service.externalTrafficPolicy=Local
```

## Installation of Nginx Ingress Controller in EKS Cluster

```
[root@yellow ~]# kubectl config use-context eks-demo-cluster-dev
Switched to context "eks-demo-cluster-dev".
[root@Terraform-Server ~]# kubectl create ns ingress-nginx
namespace/ingress-nginx created
[root@yellow ~]# helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
"ingress-nginx" already exists with the same configuration, skipping
[root@yellow ~]# helm repo update
Hang tight while we grab the latest from your chart repositories...
...Successfully got an update from the "ingress-nginx" chart repository
Update Complete. ⚡Happy Helm-ing!⚡
[root@yellow ~]# helm install ingress-nginx ingress-nginx/ingress-nginx -n ingress-nginx --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-ssl-cert"="arn:aws:acm:us-east-2:02XXXXXX6:certificate/XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXX" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-connection-idle-timeout"="60" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-type"="elb" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-backend-protocol"="http" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-ssl-ports"="https" --set controller.service.targetPorts.https=http --set-string controller.config.use-forwarded-headers="true"
```

**kubectl create ns ingress-nginx**

**helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx**

**helm repo update**

**helm install ingress-nginx ingress-nginx/ingress-nginx -n ingress-nginx --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-ssl-cert"="arn:aws:acm:us-east-2:02XXXXXX6:certificate/XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXX" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-connection-idle-timeout"="60" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-cross-zone-load-balancing-enabled"="true" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-type"="elb" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-backend-protocol"="http" --set controller.service.annotations."service\\.beta\\.kubernetes\\.io/aws-load-balancer-ssl-ports"="https" --set controller.service.targetPorts.https=http --set-string controller.config.use-forwarded-headers="true"**

```
[root@██████████ ~]# kubectl get all -n ingress-nginx --context=aks-cluster
NAME                                         READY   STATUS    RESTARTS   AGE
pod/ingress-nginx-controller-6██████████g   1/1    Running   0          10m
NAME                                     TYPE        CLUSTER-IP   EXTERNAL-IP   PORT(S)          AGE

replicaset.apps/ingress-nginx-controller-6██████████g   4       1       1       2m19s
```

Ritesh Kumar Singh

```
[root@REDACTED ~]# cat consul-values.yaml
global:
  image: "hashicorp/consul:1.20.5"
  peering:
    enabled: true
  tls:
    enabled: true

server:
  replicas: 1
  bootstrapExpect: 1
  extraConfig: |
    {
      "log_level": "TRACE"
    }

connectInject:
  enabled: true
  default: false

meshGateway:
  enabled: true
  replicas: 1

controller:
  enabled: true

ui:
  enabled: true
  service:
    enabled: true
    type: ClusterIP
```

Ritesh  
Singh

```
cat consul-values.yaml

global:
  image: "hashicorp/consul:1.20.5"
  peering:
    enabled: true
  tls:
    enabled: true

server:
  replicas: 1
  bootstrapExpect: 1
  extraConfig: |
    {
      "log_level": "TRACE"
    }

connectInject:
  enabled: true
  default: false

meshGateway:
  enabled: true
  replicas: 1

controller:
  enabled: true

ui:
  enabled: true
  service:
    enabled: true
  type: ClusterIP
```

Then I installed Consul (Service Mesh) in AKS and EKS Cluster as shown in the screenshot attached blow.

### Installation of Consul in AKS Cluster

```
helm repo add hashicorp https://helm.releases.hashicorp.com --kube-context=aks-cluster
helm search repo hashicorp/consul --kube-context=aks-cluster
helm upgrade --install consul-aks hashicorp/consul --version=1.6.3 --values=consul-values.yaml --
set global.datacenter=aks --set server.storage=10Gi --set server.storageClass=managed-csi --
namespace=consul --create-namespace --kube-context=aks-cluster
```

```
[root@XXXXXXXXXX ~]# kubectl config use-context aks-cluster
Switched to context "aks-cluster".
[root@XXXXXXXXXX ~]# helm repo add hashicorp https://helm.releases.hashicorp.com --kube-context=aks-cluster
"hashicorp" has been added to your repositories
[root@XXXXXXXXXX ~]# helm search repo hashicorp/consul --kube-context=aks-cluster
NAME          CHART VERSION APP VERSION DESCRIPTION
hashicorp/consul 1.6.4        1.20.6      Official HashiCorp Consul Chart
[root@XXXXXXXXXX ~]# helm upgrade --install consul-aks hashicorp/consul --version=1.6.3 --values=consul-values.yaml --set global.datacenter=aks --set se
rver.storage=10Gi --set server.storageClass=managed-csi --namespace=consul --create-namespace --kube-context=aks-cluster

[root@XXXXXXXXXX ~]# kubectl get all -n consul --context=aks-cluster
NAME                                         READY   STATUS    RESTARTS   AGE

          name: consul-aks-consul-ui
          port:
            number: 443
```

The screenshot shows the Azure DNS Management portal for the domain `singhritesh85.com`. In the left sidebar, the 'Recordsets' option is selected under 'DNS Management'. On the main page, it shows a table of existing record sets:

	Name	Type
@	NS	
@	SOA	

A modal window titled 'Add record set' is open, prompting for a new CNAME record. The 'Name' field contains 'f', the 'Type' is set to 'CNAME', and the 'Value' field contains 'consul-aks.singhritesh85.com'. The 'Add' button is highlighted with a yellow box.

Finally, I was able to access Consul as shown in the screenshot attached below.

The screenshot shows the Consul UI for the AKS cluster. The left sidebar includes options like Overview, Services (which is selected), Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, Organization, and Peers. The main area displays the 'Services' section with the following details:

Services 2 total	
<span style="color: green;">✓</span> consul	1 instance
<span style="color: green;">✓</span> mesh-gateway	1 instance

### Installation of Consul in AKS Cluster

```

helm repo add hashicorp https://helm.releases.hashicorp.com --kube-context=eks-demo-cluster-dev
helm search repo hashicorp/consul --kube-context=eks-demo-cluster-dev
helm upgrade --install consul-eks hashicorp/consul --version=1.6.3 --values=consul-values.yaml --set global.datacenter=eks --set server.storage=10Gi --set server.storageClass=gp2 --namespace=consul --create-namespace --kube-context=eks-demo-cluster-dev

```

```
[root@XXXXXXXXXX ~]# kubectl config use-context eks-demo-cluster-dev
Switched to context "eks-demo-cluster-dev".
[root@XXXXXXXXXX ~]# helm repo add hashicorp https://helm.releases.hashicorp.com --kube-context=eks-demo-cluster-dev
"hashicorp" already exists with the same configuration, skipping
[root@XXXXXXXXXX ~]# helm search repo hashicorp/consul --kube-context=eks-demo-cluster-dev

A record set is a collection of records in a zone that have the same name and type. They are used to manage multiple IP addresses or other data for a single domain name. Learn more

Name	Type
@	NS

Add or remove favorites by pressing **Ctrl+Shift+F**

Finally, I was able to access Consul as shown in the screenshot attached below.

Services 2 total

Service	Type	Status
consul	1 instance	Green
mesh-gateway	1 instance	Green

Now my aim is to deploy the online boutique microservice based application in EKS and AKS Cluster to achieve the Disaster Recovery (DR). I am elaborating more on the aim if any of the service (consider as shippingservice) gets deleted in EKS Cluster then the service can be accessible through the microservice deployed in AKS Cluster.

To achieve this aim, I had created a namespace **microservice** in EKS and AKS Cluster. Then I had applied the label **connect-inject=enabled** to the namespace **microservice** to create the envoy proxy sidecar containers in the EKS and AKS Cluster. Although I had applied the label to the namespace but I should also apply the annotations **consul.hashicorp.com/connect-inject: 'true'** with each of the deployment in that namespace.

```
kubectl create ns microservice --context=eks-demo-cluster-dev
kubectl create ns microservice --context=aks-cluster
kubectl label --context=aks-cluster namespace microservice connect-inject=enabled
kubectl label --context=eks-demo-cluster-dev namespace microservice connect-inject=enabled
```

```
[root@] ~]# kubectl create ns microservice --context=eks-demo-cluster-dev
namespace/microservice created
[root@] ~]# kubectl create ns microservice --context=aks-cluster
namespace/microservice created
[root@] ~]# kubectl label --context=aks-cluster namespace microservice connect-inject=enabled
namespace/microservice labeled
[root@] ~]# kubectl label --context=eks-demo-cluster-dev namespace microservice connect-inject=enabled
namespace/microservice labeled

[root@] release]# kubectl get ns microservice --show-labels --context=eks-demo-cluster-dev
NAME      STATUS   AGE     LABELS
microservice   Active  16m    connect-inject=enabled,kubernetes.io/metadata.name=microservice
[root@] release]# kubectl get ns microservice --show-labels --context=aks-cluster
NAME      STATUS   AGE     LABELS
microservice   Active  16m    connect-inject=enabled,kubernetes.io/metadata.name=microservice
```

Then I had deployed the online boutique microservice based application in EKS and AKS Cluster using the manifests file which is present in the GitHub Repo <https://github.com/singhritesh85/consul-crash-course.git> at the path **kubernetes** and the file name is **config-consul.yaml**.

```
[root@] ~]# git clone https://github.com/singhritesh85/consul-crash-course.git

```

Then I created the ingress rule and hence the HOST and DNS Name of the LoadBalancer which entry I did in the Azure DNS Zone to create the Record Set of type CNAME as shown in the screenshot attached below.

The screenshot shows the Azure portal interface for managing DNS records. On the left, the navigation menu includes 'Overview', 'Activity log', 'Access control (IAM)', 'Tags', 'Diagnose and solve problems', 'Resource visualizer', 'Settings', 'DNS Management', 'Recordsets' (which is selected and highlighted in blue), 'DNSSEC', 'Monitoring', 'Automation', and 'Help'. The main area displays a table of existing record sets, with one entry for '@' of type NS. To the right, a modal window titled 'Add record set' is open, prompting for a 'Name' (set to 'online-boutique'), a 'Type' (set to 'CNAME – Link your subdomain to another record'), a 'TTL' (set to '1'), and an 'Alias' (set to 'a'). At the bottom of the modal, there are 'Add', 'Cancel', and 'Give feedback' buttons, with the 'Add' button being the primary focus.

Finally, accessed the online boutique application as shown in the screenshot attached below.

At this stage shipping service is working properly which can be seen in the screenshot attached below.

The screenshot shows a 'Cart (1)' page with a single item: 'Sunglasses' (\$19.99). It also includes sections for 'Shipping Address' (with fields for E-mail Address, Street Address, Zip Code, City, State, and Country) and 'Payment Method'.

To configure Disaster Recovery first I need to connect the two clusters (EKS and AKS Clusters) using peering.

To use mesh gateway to send or accept the peering connection I need to install the CRD Mesh on both the EKS and AKS Clusters as shown in the screenshot attached below.

```
[root@yellow kubernetes]# kubectl apply -f consul-mesh-gateway.yaml -n consul --context=aks-cluster
mesh.consul.hashicorp.com/mesh created
[root@yellow kubernetes]# kubectl apply -f consul-mesh-gateway.yaml -n consul --context=eks-demo-cluster-dev
mesh.consul.hashicorp.com/mesh created
[root@yellow kubernetes]# kubectl get mesh -n consul --context=aks-cluster
NAME      SYNCED   LAST SYNCED   AGE
mesh     True      28s          28s
[root@yellow kubernetes]# kubectl get mesh -n consul --context=eks-demo-cluster-dev
NAME      SYNCED   LAST SYNCED   AGE
mesh     True      23s          23s
```

```
[root@... kubernetes]# cat consul-mesh-gateway.yaml
apiVersion: consul.hashicorp.com/v1alpha1
kind: Mesh
metadata:
  name: mesh
spec:
  peering:
    peerThroughMeshGateways: true
```

cat consul-mesh-gateway.yaml

```
apiVersion: consul.hashicorp.com/v1alpha1
kind: Mesh
metadata:
  name: mesh
spec:
  peering:
    peerThroughMeshGateways: true
```

The Mesh CRD I installed on both the EKS and AKS Cluster allows to Route traffic through Mesh Gateway.

Now I went to consul-ui of EKS Cluster and AKS Cluster and configured the peering as shown in the screenshot attached below.

Services	
paymentservice	1 instance <span style="color:red;">✗</span> in service mesh with proxy
consul	1 instance <span style="color:green;">✓</span>
mesh-gateway	1 instance <span style="color:green;">✓</span> Mesh Gateway
adservice	1 instance <span style="color:green;">✓</span> in service mesh with proxy
cartservice	1 instance <span style="color:green;">✓</span> in service mesh with proxy
checkoutservice	1 instance <span style="color:green;">✓</span> in service mesh with proxy
currencybservice	1 instance <span style="color:green;">✓</span> in service mesh with proxy
emailservice	1 instance <span style="color:green;">✓</span>

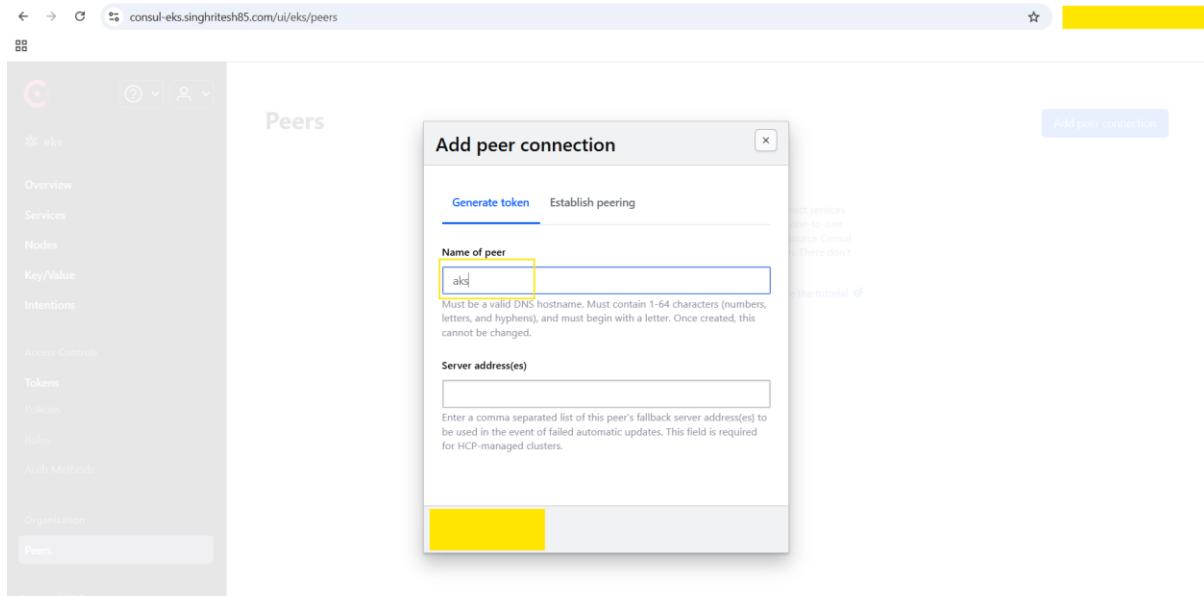

The screenshot displays two separate browser windows of the Consul UI interface.

**Top Window (Services):**

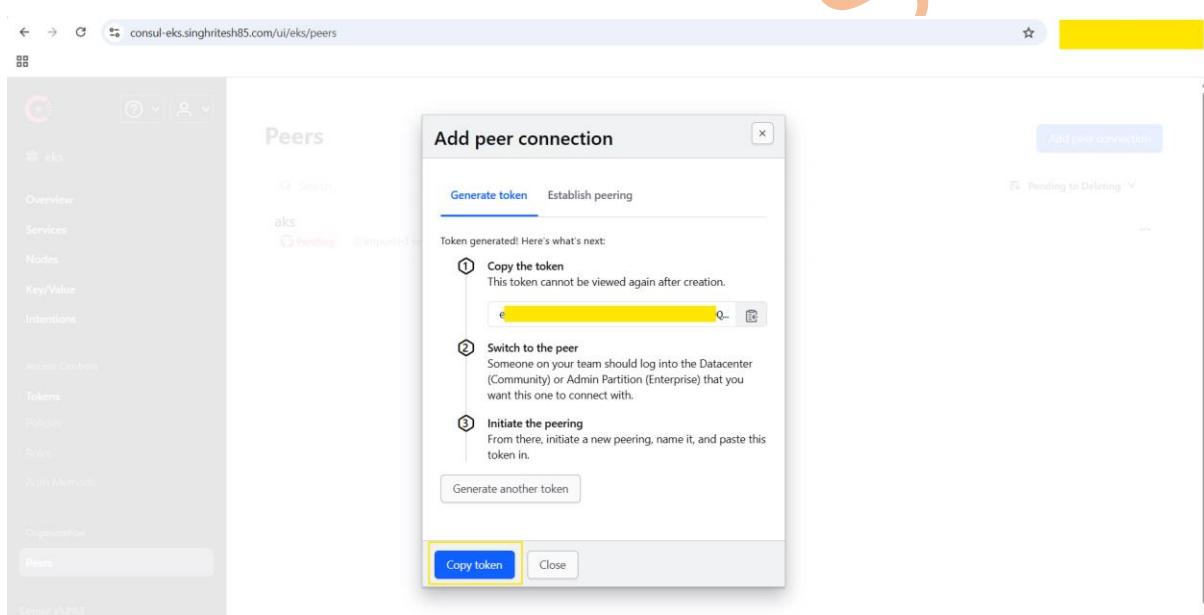

- URL: `consul-aks.singhritesh85.com/ui/aks/services`
- Left sidebar (under 'aks'): Overview, Services (selected), Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, Organization, Peers (highlighted with a yellow box).
- Right panel: Title 'Services' (13 total). Search bar, Health Status, Service Type, Sort dropdown ('Unhealthy to Healthy'). List of services:
  - paymentservice**: Red circle with 'X', 1 instance, In service mesh with proxy.
  - consul**: Green circle with checkmark, 1 instance.
  - mesh-gateway**: Green circle with checkmark, Mesh Gateway, 1 instance.
  - adservice**: Green circle with checkmark, 1 instance, In service mesh with proxy.
  - cartservice**: Green circle with checkmark, 1 instance, In service mesh with proxy.
  - checkoutservice**: Green circle with checkmark, 1 instance, In service mesh with proxy.
  - currencybservice**: Green circle with checkmark, 1 instance, In service mesh with proxy.
  - emailservice**: Green circle with checkmark.

**Bottom Window (Peers):**

- URL: `consul-eks.singhritesh85.com/ui/eks/peers`
- Left sidebar (under 'eks'): Overview, Services, Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, Organization, Peers (highlighted with a yellow box).
- Right panel: Title 'Peers'. A large orange watermark 'Ritesh' is overlaid across both panels. A blue box highlights the 'Add peer connection' button.
- Content area: 'Welcome to Peers' message, description of cluster peering, Documentation on Peers link, Take the tutorial link.

The screenshot shows the 'Add peer connection' dialog box. In the 'Name of peer' field, 'alcs' is typed. Below it, a note states: 'Must be a valid DNS hostname. Must contain 1-64 characters (numbers, letters, and hyphens), and must begin with a letter. Once created, this cannot be changed.' The 'Server address(es)' field is empty. At the bottom right of the dialog are 'Copy token' and 'Close' buttons.

The screenshot shows the 'Add peer connection' dialog box after the token has been copied. The status bar at the top now displays 'Pending to Deleting'. The token itself is visible in the clipboard icon. The 'Copy token' button is highlighted with a yellow box.

Now it is pending state as can be seen in the screenshot attached below.

The image displays two screenshots of the Consul UI interface, one for the eks cluster and one for the aks cluster.

**eks Cluster Screenshot:**

- Header:** consul-eks.singhritesh85.com/ui/eks/peers
- Sidebar:** Overview, Services, Nodes, Key/Value, Intentions, Access Controls, Tokens (selected), Policies, Roles, Auth Methods, Organization, Peers (selected).
- Content:** Title: Peers. Search bar, Status dropdown, Pending to Deleting status indicator. A single peer entry for "aks" is listed with a "Pending" status, 0 imported services, and 0 exported services. An "Add peer connection" button is at the top right.

**aks Cluster Screenshot:**

- Header:** consul-aks.singhritesh85.com/ui/aks/peers
- Sidebar:** Overview, Services, Nodes, Key/Value, Intentions, Access Controls, Tokens (selected), Policies, Roles, Auth Methods, Organization, Peers (selected).
- Content:** Title: Peers. A "Welcome to Peers" message is displayed. It states: "Cluster peering is the recommended way to connect services across or within Consul datacenters. Peering is a one-to-one relationship in which each peer is either a open-source Consul datacenter or a Consul enterprise admin partition. There don't seem to be any peers for this datacenter." Below the message are links for "Documentation on Peers" and "Take the tutorial". An "Add peer connection" button is at the top right.

Peers

Add peer connection

Generate token **Establish peering**

Name of peer: eks

Token: [REDACTED]

Add peer

Finally, peering had been established as shown in the screenshot attached below.

All Peers

**eks**

Status	Latest heartbeat	Latest receipt	Latest send
✓ Active	None yet	a few seconds ago	a few seconds ago

Imported Services    Exported Services    Server Addresses

No visible imported services from eks

Services must be exported from one peer to another to enable service communication across two peers. There don't seem to be any services imported from eks yet, or you may not have services:read permissions to access to this view.

Documentation on Peers [Take the tutorial](#)

Success!  
Your peer has been saved.

The screenshot shows the Consul UI interface. On the left is a sidebar with various navigation options: Overview, Services, Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, Organization, and Peers. The 'Peers' option is selected and highlighted with a grey background. The main area is titled 'Peers' and contains a table with one row. The row for 'aks' is highlighted with a yellow box. The table columns include 'aks', 'Active', '0 imported services', and '0 exported services'. There is also a status dropdown menu and a pending deletion notice.

```
[root@REDACTED kubernetes]# kubectl apply -f exported-service.yaml --context=aks-cluster
exportedservices.consul.hashicorp.com/default created
[root@REDACTED kubernetes]# kubectl apply -f service-resolver.yaml --context=eks-demo-cluster-dev
serviceresolver.consul.hashicorp.com/shippingservice created
[root@REDACTED kubernetes]# cat exported-service.yaml
apiVersion: consul.hashicorp.com/v1alpha1
kind: ExportedServices
metadata:
  name: default
spec:
  services:
    - name: "shippingservice"
      consumers:
        - peer: eks

[root@REDACTED kubernetes]# cat service-resolver.yaml
apiVersion: consul.hashicorp.com/v1alpha1
kind: ServiceResolver
metadata:
  name: shippingservice
spec:
  connectTimeout: 15s
  failover:
    '*':
      targets:
        - peer: 'aks'
```

Then I checked the ui of consul for AKS and EKS cluster and found that exported and imported service as **shippingservice** respectively.

The screenshot shows two instances of the Consul UI interface. The top instance is for the EKS cluster, and the bottom instance is for the AKS cluster. Both instances are displaying the 'Peers' section.

**EKS Cluster (Top):**

- Left Sidebar:** Shows navigation links for Overview, Services, Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, and Organization. The 'Peers' link is highlighted.
- Header:** URL: consul-eks.singhritesh85.com/ui/aks/peers/eks/exported-services
- Content:** Title: All Peers - eks. Status: Active. Latest heartbeat: A few seconds ago. Latest receipt: a few seconds ago. Latest send: a few seconds ago. Tab: Exported Services (highlighted). Search bar: Q Search. Result: shippingservice (highlighted with a yellow box).

**AKS Cluster (Bottom):**

- Left Sidebar:** Shows navigation links for Overview, Services, Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, and Organization. The 'Peers' link is highlighted.
- Header:** URL: consul-eks.singhritesh85.com/ui/eks/peers/aks/imported-services
- Content:** Title: All Peers - eks. Status: Active. Latest heartbeat: A few seconds ago. Latest receipt: a few seconds ago. Latest send: 27 minutes ago. Tab: Imported Services (highlighted). Search bar: Q Search. Result: shippingservice (highlighted with a yellow box). Filter: Health Status: Unhealthy to Healthy.

The screenshot shows the Consul UI interface for an EKS cluster. The left sidebar has options like Overview, Services (which is selected), Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, Organization, and Peers. The main area is titled "Services 14 total". It lists the following services:

- emailservice: 1 instance, healthy, in service mesh with proxy
- frontend-external: 1 instance, healthy, in service mesh with proxy
- productcatalogservice: 1 instance, healthy, in service mesh with proxy
- recommendationservice: 1 instance, healthy, in service mesh with proxy
- redis-cart: 1 instance, healthy, in service mesh with proxy
- shippingservice: 1 instance, healthy, in service mesh with proxy
- shippingservice: 1 instance, healthy, in service mesh with proxy

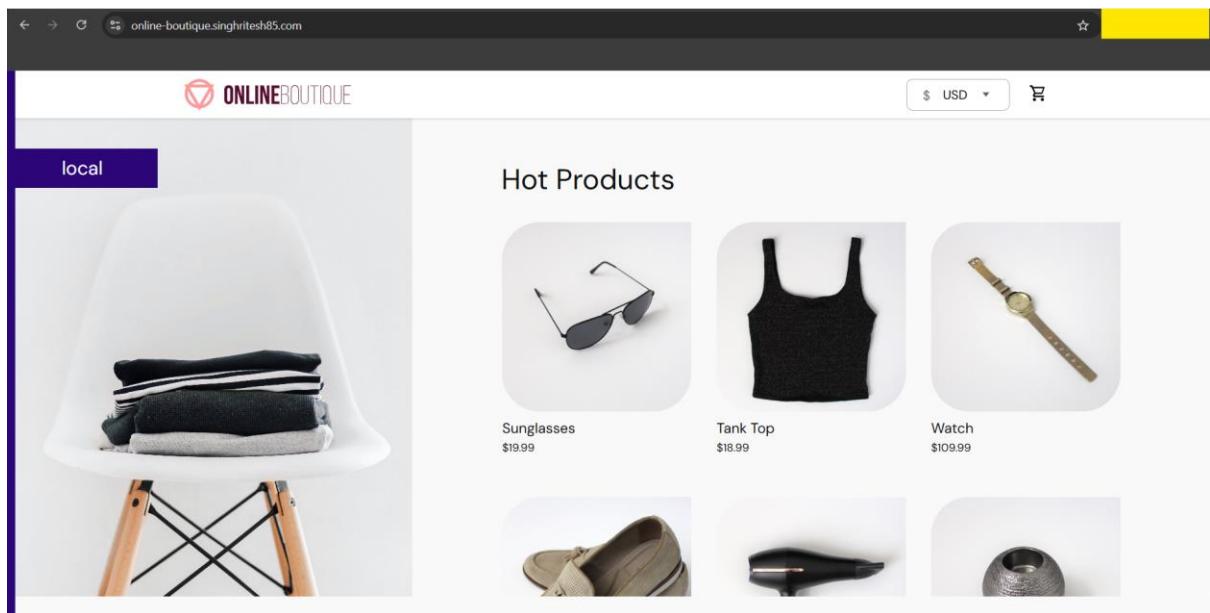

Now, I deleted the shippingservice deployment in EKS Cluster and checked whether it working properly or not through the shipping service in AKS Cluster as shown in the screenshot attached below.

```
[root@xxxxxxxxx kubernetes]# kubectl delete deploy shippingservice -n microservice --context=eks-demo-cluster-dev
deployment.apps "shippingservice" deleted
```

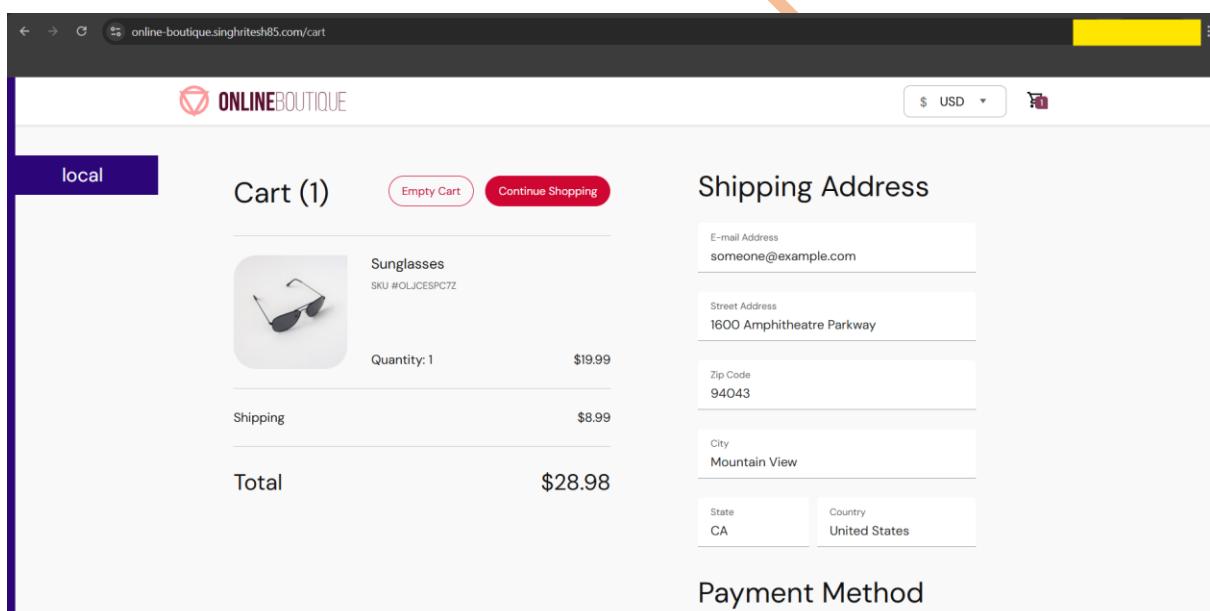

```
[root@xxxxxxxxx kubernetes]# kubectl get pods -n microservice --context=eks-demo-cluster-dev --watch
NAME                               READY   STATUS    RESTARTS   AGE
adservice-857bf87485-1c6jr        2/2     Running   0          88m
cartservice-644f9d65cd-ksw7p      2/2     Running   0          88m
checkoutservice-5696787454-hxx28  2/2     Running   0          88m
currencyservice-6d99654d6f-n4dvk  2/2     Running   0          88m
emailservice-74698d99d9-w42bx    2/2     Running   0          88m
frontend-5476787c94-fp669       2/2     Running   0          88m
paymentservice-669944c9f-9mjht   1/2     CrashLoopBackOff 22 (48s ago) 88m
productcatalogservice-98fcfd4b5-krzft 2/2     Running   0          88m
recommendationservice-77d79ff5d5-fksp8 2/2     Running   0          88m
redis-cart-689bb95f4-ccscr       2/2     Running   0          88m
```

The screenshot shows the Consul UI interface for an EKS cluster. The left sidebar has options like Overview, Services (selected), Nodes, Key/Value, Intentions, Access Controls, Tokens, Policies, Roles, Auth Methods, Organization, and Peers. The main area is titled "Services 13 total". It lists the following services:

- currencyservice: 1 instance, healthy, in service mesh with proxy
- emailservice: 1 instance, healthy, in service mesh with proxy
- frontend-external: 1 instance, healthy, in service mesh with proxy
- productcatalogservice: 1 instance, healthy, in service mesh with proxy
- recommendationservice: 1 instance, healthy, in service mesh with proxy
- redis-cart: 1 instance, healthy, in service mesh with proxy
- shippingservice: 1 instance, healthy, in service mesh with proxy

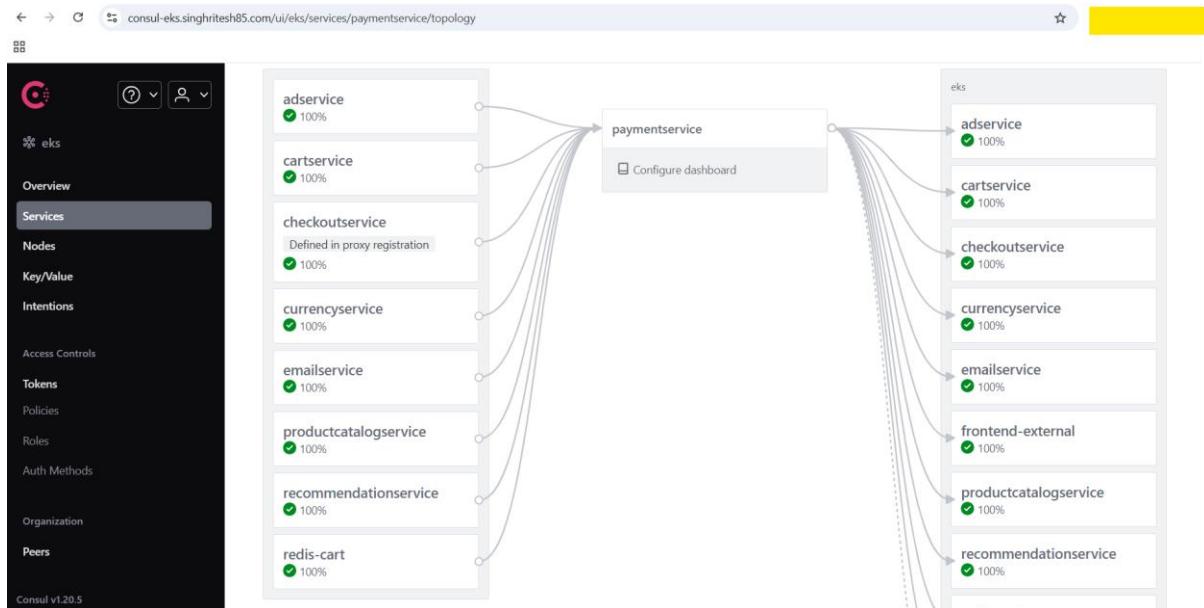

Finally, I found shippingservice failover is working properly as shown in the screenshot attached below.

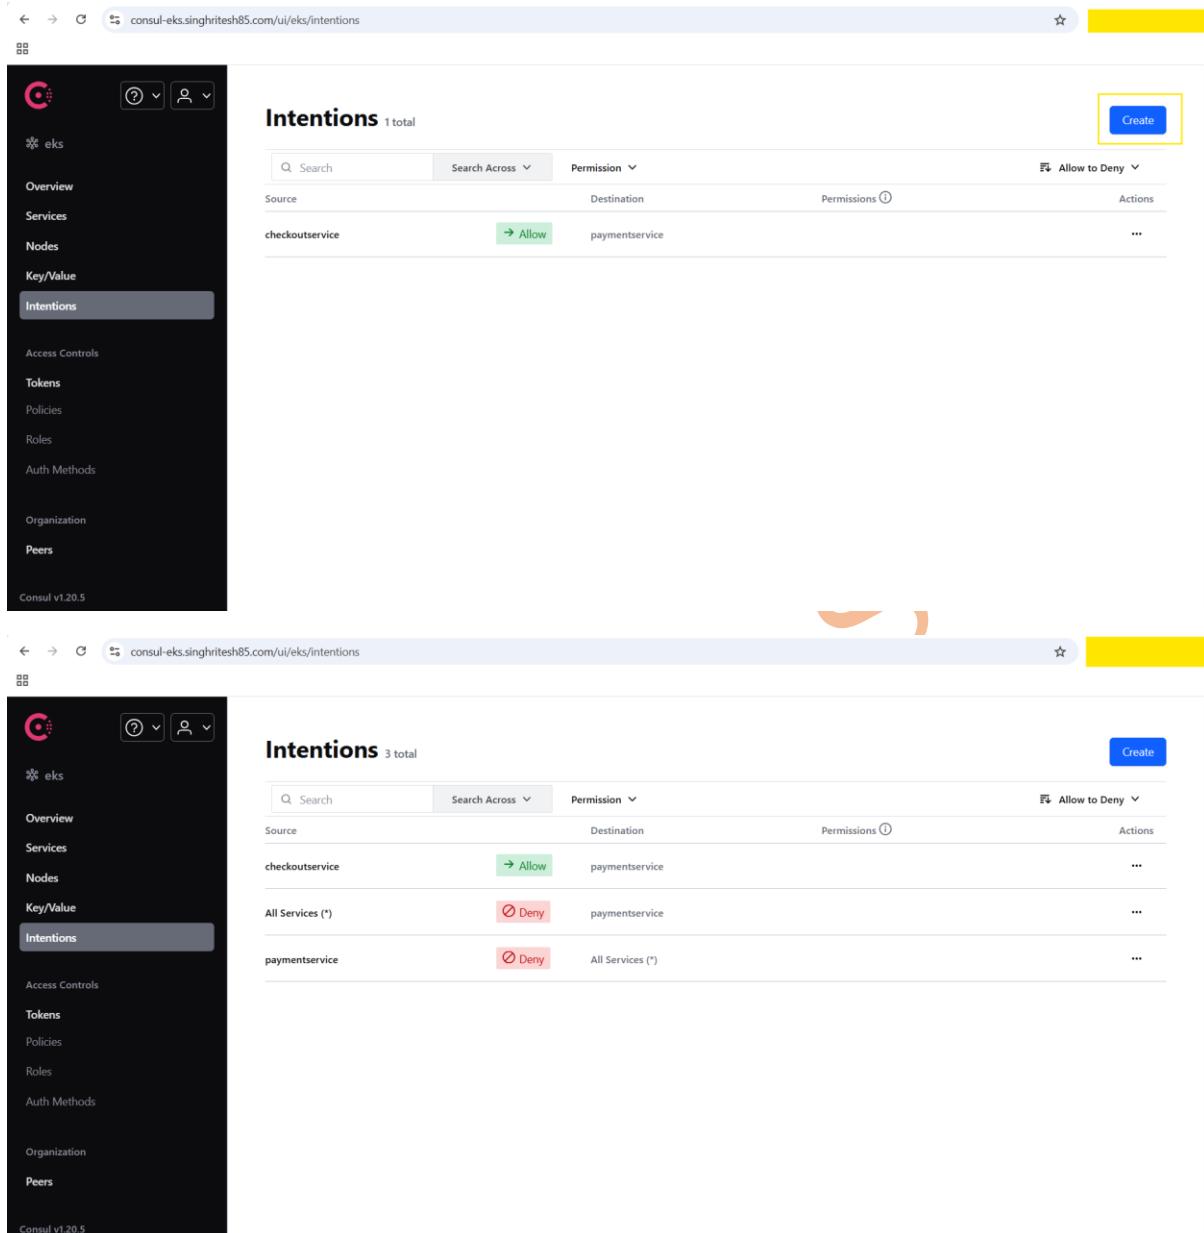

### Restrict using Consul UI that which service can communicate to which service

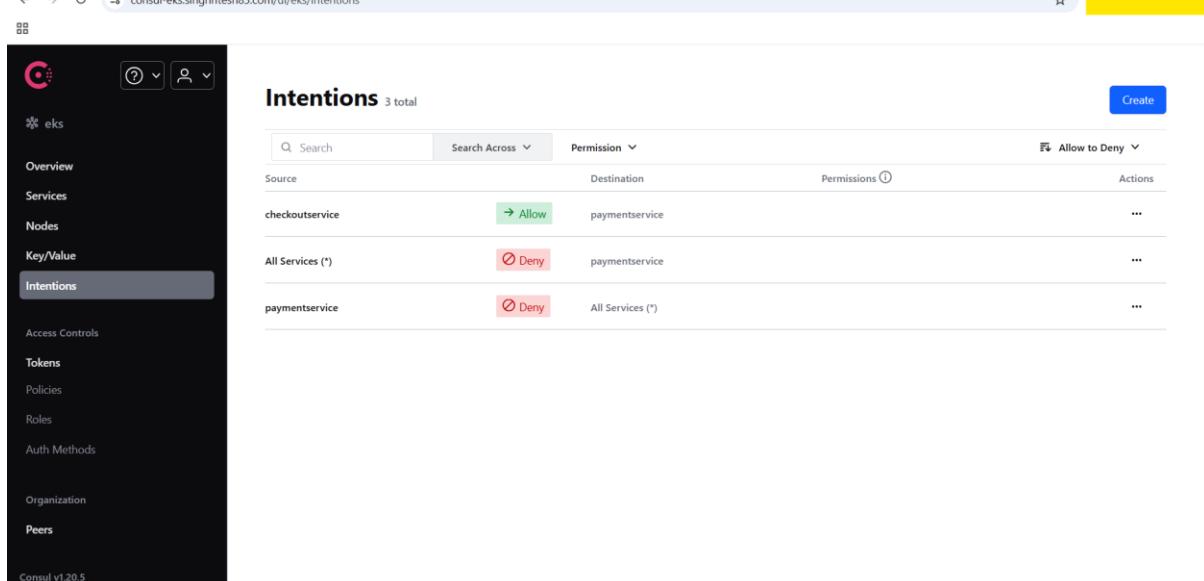

Through the consul ui I am restricting that which service communicates with which service for this I am taking an example of paymentservice. At present payment service can communicate with all the services as shown in the screenshot attached below.

Now go to **Intentions** present in the left side column and create the restriction Rule as shown in the screenshot attached below.

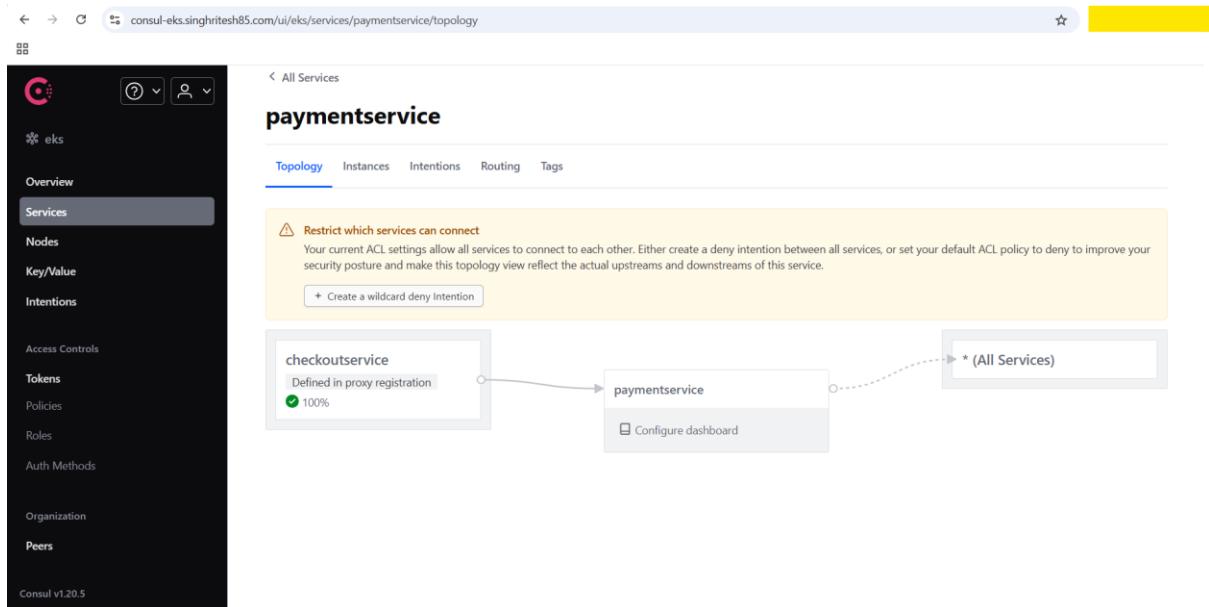

The screenshot shows the Consul UI interface for managing intentions. The left sidebar is dark-themed and includes links for Overview, Services, Nodes, Key/Value, Intentions (which is selected), Access Controls, Tokens, Policies, Roles, Auth Methods, Organization, and Peers. The main panel title is "Intentions 1 total". It features a search bar, a "Permission" dropdown set to "Allow", and a "Create" button. A single intention is listed: "checkoutservice" has an "Allow" permission to "paymentservice".

This screenshot shows the same Consul UI interface, but with three intentions listed. The first intention is the same as the previous one: "checkoutservice" has an "Allow" permission to "paymentservice". The second intention is "All Services (\*)" with a "Deny" permission to "paymentservice". The third intention is "paymentservice" with a "Deny" permission to "All Services (\*)".

It means now the traffic to paymentservice can only go from checkoutservice and no other service can communicate with paymentservice. Traffic from payment service cannot go outside which can also be verified with the screenshot attached below.

Ritesh Kumar
